Wouldn't be the first time that a cop made a mistake. Recently had a
case here in Arkansas in which a state trooper arrested a guy for
giving him a middle-finger salute. The guy won in court, so far, and
the cop was fined $4,000, but they may appeal it later, too.

And the tow truck scene in Houston is just Fing amazing.

Never have I seen such a clusterfuck in America as the idiot tow truck drivers in Houston.

And I have first hand knowledge. My brother in law owns a tow truck company here. Like fucking vultures they are.

Got a problem with it.

Get an amateur radio license plate.

Problem solved...

Although, I would sue if I was being harassed for having an antenna on my car.

I went through similar problems in So Cal when I lived their. If you had a CB antenna on your car, and where out after 2 in the morning, you would be pulled over, and your car searched for illicit narcotics, just "because most CBers are drug users in this area".

I travelled from Houston, Texas to Ponca City OK every other weekend for 6 months, with an antenna on my car, and was never stopped.

Once must wonder if their are other things that are attracting the officers.

> I'm curious about the amp too. What's a 4-pill cookie with a
> 3 button Texas Star mod?

It is a 4 X 2SC2879 amplifier and a texas Star Modulator Plus amp.

One is the "pump", and one is the driver.

Having helped Mike build some of his CV-500 amps, I will tell ya that they aren't bad, especially for the money.

Why not buy a TS500....? Because Mikes amps hold up at 19 volts, whereas a TS has a hard time at 15.

Depends on what you want.

Toll Free

Why not just have a Texas Star 500.

Who gives a shit what the SWR was, what was the IMPEDANCE of the antenna system

Again, people hook up SWR meters and think they have it all set up.

If you want to run transistors on the ragged edge (and the X-Force base boxes do), you need to measure IMPEDANCE.

I have owned a few X-Force base amps. They operate at 18.9v and did fine for me, although I didn't drive them hard and my SWR was 1.2:1. When I took it to the shop to test output and just look over it, they said it was similar to a Dave, except for bigger heat sink and different biasing. They didn't say anything about cheap parts.

Bravotek here:

This is about GE 40 Channel Hand held CB radios: model number: 3-5980A, FCC-ID: MUD3-5980.

A friend and I want to open know the case of these units for educational purposes. My friend has several of these models and he wants to show his communication systems class different radio parts and what is different in a mobil, base, and hand held. We cannot seem to find the schematics on this model or exactly how to open it. There are 2 screws that hold the case together but there is something inside that prevents opening. So if directions on opening this unit correctly can be provided along with or even apart from the schematics, please give those to us. The units used in the class are not in complete working condition (I do not know where the school got them from, but they are lucky they got this stuff at the least). We do not want to rip them apart, my friend also want to teach the kids simple repair techniques in small electronics. I had to donate some soldering kits to the class for the students to learn with. Thanks for any help!

535 N. Carolina, bravotek

Well, if YOU were an amateur, you would know that the original Tech license required code. Later techs with original licenses issued from 1991 required no code, hence 'no-code tech'. Current techs whose licenses were issued prior to a specific date in 1987 can upgrade to general for the cost of the paperwork. A 'no-code tech' still has to complete the code requirement. Both licenses may specify 'Technician'. The difference is in the code requirements and the privileges.

Professor wrote:
>
> What do you mean by this?

Mods are becoming commonplace that manipulate
the waveform in such a way as to cause positive
carrier shift. Negative peak compression is
the term for those mods that seems to be coming
to the surface.

With positive carrier shift the average wattage
increases with modulation. In that situation
there's no benefit in setting the carrier value
any higher than is necessary to reliably key
the amp.

Sounds like a bunch of local "bubba's" harrasing you and waiting for you like vultures for you to screw up
so they can pay for their news radio's that you won't be able to listen to.
It's amazing how those who have the most protection (guns and ammunition) are those who are in most need
of being taken out of the gene pool. Also, it's amazing that those who need to be monitored the most are those
who are trying to make monitoring illegal.

I'm not completely clear on this. Are they both
in the same box? In other words, why is it called
a 3 button Texas Star mod rather than being advertised
as two separate amps that are being used together?

Just wondering if these radios were any good. I was told that the radio itself was ok, but the amp was not. I herd that it ran a high swr, and had other problems. Is there any truth in this. Anybody out there know?

3542. Sigma 5/8 Base Antenna

Newsgroup: rec.radio.cb
Date: 2000-08-27 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <39A97964.6A0947C8@qnet.com>
Source record: 50058

Hello Rick: I need a better e-mail address that Rickatdotcom. This e-mail address won't work.

The Sigma 5/8 probably will not last a long time to heavy winds and ice up there in Alaska, in my opinion. It is supported by only 5 3/4 inches at the base for a 266 inch long vertical element. The base mounting assembly can be reinforced and made much stronger, with other larger pieces of Fiberglass thick walled tubing. That ain't cheap. You half to use high quality stainless steel hose clamps to hold the added Fibreglass tubing on the antenna. The top hose clamps must be connected to the antennas vertical element, so that the pattern and impedance is NOT changed.

The vertical element can have a black double braided Dacron/Polyester antenna rope attached to about 3/4 the way up the antenna, not to tight, but to add support to the antenna. Call the guys at Synthertic Textiles Inc. at 714-630-2134. You will need 3/16 or larger diameter.

The ground plane mounting bracket is the same bracket as used on the Moonraker 4 and 6 Beam Antennas, which if tighten to much will break and crack, at the upper holes and be unusable. These aluminium cast brackets some times just break after the antenna is installed. A poor design. A bracket made of aluminium sheet metal formed in a vice or hammered a little will work much better. Use 2024T3 .070 or .080 inches thick, which is a soft aluminium, and easy to form. The 5052, or 6061 will be a bitch to form.

The ground plane radials will last for a long tine, along with the vertical element. Use good quality automotive stainless steel hose clamps. There are cheap hose clamps out there that will rust.

The antenna should be mounted with the mast side by side, using good quality stainless steel U-bolts available at
http://www.mcmaster.com/

Suggest you have the coax already connected and weather proofed on the antenna, before installing the antenna on the mast. If you see where the SO-239 connector is located you will agree.

The vertical and horizontal elements should be weather proofed at the connection joints, using a black Silicon RTV, with a small #40 hole drilled in the bottom vertical element to allow for proper water drainage.

If you need the assembly instructions I can sent them to you, if you have a real e-maill address.

Hope this helps.

Jay in the Mojave

Funny thing, this... it's true...

When I was an OTR Truck driver, I had a dipole antenna for 11M on the passenger mirror of the T-600. I think I was pulled behind the "chicken coop" (Weigh Station for those who aren't familiar with the lingo) at least 8 times, just because the scalemaster wanted to see what kind of contraption I had hanging off my truck... This was usually accompanied by a level 2 truck inspection, as well, and they had the "puppies" out sniffin, too. I didn't mind, really. I usually ran legal, and never carried contraband, and it gave me a chance to step out of the truck, sit back and chuckle at an idiot who thought we was gonna get the bust of the century.

At least it kept a few of the other trucks out of the coop for awhile, while they messed with me for no reason. ::chuckle::

Now aren't you glad they're spending your tax dollars in such a haphazard fashion?

> meters just as accurate, and much cheaper. The Bird is
> a VSWR meter just as most of the others are.
> 'Doc
-==========
name just a few meters ? the bird uses a 50 ohm line section with plug in
elements it reads reflected power and forward power simutaneously giving you
the ability to calculate swr not a common swr meter at all.

==========
you have no idea then how a bird meter works it samples voltage and it is
seperated by turning the slug in the other direction to read reflected
power.

..snip....
> Also, most "garden variety" voltmeters actually work identically
> to a Bird meter. The additional cost of a Bird meter goes only
> toward tighter manufacturing tolerances (for more accurate power

> Furthermore, since SWR measurements are relative measurements, there
> is really no need to know exactly how many watts are traveling in
> each direction. Thus, the extra money spent on a Bird meter for
> SWR measurements actually buys you little or nothing.
==========
swr measurements are relative haha... you are right to each other. How do
you think swr comes about it is a ratio of foward power compared to reflect
power. If you dont know the forward power how can you compare the reflect
power to it and vice versa No radio shack meter even comes close to this ...
get off the pipe ...

: impedance can affect the SWR readings.

No, that is not true. It does not matter if the radio or amplifer output impedance is 5 ohms or 5000 ohms - it still will not affect the SWR. All that matters is the impedance of the antenna and the coax connected to the antenna.

Sounds like what happened earlier this year down around the Flying J
and Pilot truck stops on the south side of Indianapolis. Of course,
myself and a couple other truck drivers caught a Smokey Bear running
some inordinate power behind the McDonald's, jamming channel 19... I
walked up to his police car, and he just drove off. Wonder what the
legality of THAT situation was...

Funny you should mention that... My all time record for not having to go thru any chicken coops was 6 months, 1 week, and 5 days. No, I wasn't dodgin the nest, and no, I wasn't just driving at night. Just got lucky, I guess.

Driving's a thing of the past, for me, now, thanks to that DU who was runnin from the cops, hopped the median, and pinned me in my truck for a little over 6 hours. Oh, I might be able to take a local job, but who really wants to deal with shippers and receivers all day long? ::Grin::

Just my two cents.

I hear what you are saying Jim. As far as worldwide DX, it is done on a regular basis with barefoot radios all the time, especially on sideband. I'm not on a beam, just a groundplane and nowhere near the height you mentioned. 12 watts out on the side has given me some great worldwide DX. I applaud your patriotism for feeling the way you do in that the Feds and broadcasters fear escalating power wars if DX was permtted. However, I'm what you might call a cynic on one hand and paranoid on the other, when it comes to this matter. I feel that for starters, the Feds will never admit they made a mistake. And secondly, I have heard some pretty wild pirate radio on sideband and don't you just know that corporate radio is scared to death of these stations, why do you think the broadcasters association opposed the recent allocation and expansion of community based low power FM stations? Corporate B$ is why. Money. Money in lost revenue. Just to clarify, it wasn't the rule limiting power output I am taking issue with, rather it is the rule governing the distance permitted to talk. Hey, ya' know what? It's not paranoia if they REALLY are after you! Happy DXing!

This is just not true at all, unless you are using a cheap meter. If your SWR changes with more power applied then you have a problem. Having an amplifier on is a good way to test for a breakdown in the feedline but some amplifiers will cause meters like dosy and some of the other "SWR" meters to read a high SWR, This is either caused by output tuning of the amp or harmonics. I believe one should spend the money and go with a Bird43. Rugged, accurate and a hell of lot more reliable in the long run.

That's not gonna happen.....trust me on this.

My company sells radios to terrorist and drug smugglers. We sell only
the best seneca systems to our underworld clients. Some companys will
sell ham radios to third world countrys, but that ham gear is cheap and
is not durable in the hands the 12 year old rebels.

Now forget I was here or I will have to kill all of you on this ng.

A better plan is to tell me what multi-mode
radios you have. The common negative peak
compression mods apply to chassis' with AM
regulators rather than audio output trans-
formers. I'd prefer to give you an example
that you can apply and experiment with.

If you want to bypass me and do all this on
the sly, join the cb tricks mailing list.
It's an e-groups mailing list. Go to e-
groups.com, join the cbtricks mailing list,
and read the posts that apply to the Connex/
Galaxy mods for the last month or so. All
the gory details are there.

Hmmm... those hams are so hot to turn in "outlaw" radio
operators to the Feds. And now law enforcement is targeting
hams. How ironic. "How does it feel?"

I agree. Every push-pull pair based, solid-state
amp that uses ferrite in any way should be called a
"Helge-made" amp.

Dave didn't create that technology--Dave hasn't
created ANY technology. Dave is like the Japanese--
he's good at standing on the shoulders of others
technology-wise. He finds the best of what exists,
recreates it and builds upon it for his own profit.

Being the best doesn't mean being the first.

That's not necessarily true. The receiver is noisy and the
noise rejection is basically non-existent.

> I herd that it ran a high swr, and
> had other problems. Is there any truth in this. Anybody out there know?

The 2970 is full of compromises. The final amp stage
is one of them. It is far from unconditionally stable.
Add a generous amount of negative feedback and ease up
on the bias, and it's not too bad.

They're basically the same radio, with the exception of the PLL.. Most
of the 2010's I've seen have had the 8734 PLL (Which doesn't do all
the "channels" the 8719 does. They're a pop and swap replacement, so
if you want to do the "channel" mod, find an 8719 to put in place of
the 8734.

Aside from that, they're basically the same radio, internally.

If I'm wrong about any other points on this, I'm sure someone will
correct me on it.

As for the coax, any length will do... point to point, plus a few
inches to "play with" in case things need to be moved, etc...

As for the power lines, I'd run at least 10 guage, and prefer 8 or 6..
The bigger, the better, for power. 6 would not be overkill...

Scott when did you see a 1 volt drop, while you were keyed up i am assuming. You may not have enough current to supply the 667. I would not fault the guage of wire automatically How many amps does the 667 draw? i am sure it is more than 40 amps on peaks. using the 6 guage should be fine for 40 amp peaks

Use what ever length you need to reach the amp, do not be suckered into the cb myth that it has to be certain lengths. If the input to the amp is designed properly the radio will see a good swr.

What's the problem? CB was not intended to be for DXing anyway. Read
the rules. Hams have to follow the rules (and most do except a very
small handful and they get caught fairly quickly) so why shouldn't
CBers follow their rules? Use the service for what it was intended and
you'll be fine. Rather simple isn't it?

Hello, this unit has the MB 8719 PLL chip,
so it is easily modifiable for extra channels.
Search around someone may give you the mod.
Good radio...

> > is grounded is arbitrary.
>
> And just where is RF ground?

"RF ground" is a relative term. In this case, it refers to how well the radio ground (at the radio case) is connected to the vehicle ground. Under typical circumstances, no connection between the radio case and vehicle chassis is necessary for proper operation. You could plug the antenna cable into a walkie-talkie and it will work perfectly.

The issue is what happens to common mode currents traveling down the outside of the antenna coax. The radio may or may not have a good RF connection to the vehicle chassis. I can't tell you what you have; I have no idea. Consequently, I cannot predict how common mode currents will behave when the arrive at your radio. tnom@mucks.net believes that somehow 18 feet of coax will bring these common mode currents under control. If they can't be predicted at the radio and they can't be predicted at the antenna, how can one predict them by adding 18 feet of coax? There is simply no way.

>
> Jack

Actually, this is not the case. Virtually all "garden variety" SWR meters sense both voltage and current; they must in order to provide a directional reading. Merely measuring voltage would allow no means to separate forward voltage from reflected voltage.

Also, most "garden variety" voltmeters actually work identically to a Bird meter. The additional cost of a Bird meter goes only toward tighter manufacturing tolerances (for more accurate power readings over a larger frequency range) and slug interchangability.

The technology used in a Bird meter is no different than that used in a Radio Shack SWR meter. The Bird meter is no more of a "true reflectometer" than the Radio Shack meter.

Furthermore, since SWR measurements are relative measurements, there is really no need to know exactly how many watts are traveling in each direction. Thus, the extra money spent on a Bird meter for SWR measurements actually buys you little or nothing.

> 'Doc

Most common SWR meters sense both voltage and current (see my
other post about this).

Even with common SWR meters, changing the power level alone will
not change the SWR reading.

The typical reason for a different SWR reading with an amplifier
versus the barefoot radio is the fact that the amplifier output
is rich in power at the harmonic frequencies. These harmonic
frequencies do not see your nice match at 27 MHz. Thus, much of
that power is reflected back to your radio where it shows up
as what appears to be a higher SWR reading. The realitiy is
that the SWR at 27 MHz is the same; you are now detecting power
at 54 MHz where the SWR is not so good. SWR meters are generally
not frequency selective; you cannot make them only detect the
power at 27 MHz.

The impedance of the radio or amplifier cannot affect the SWR reading.

I don't think a single incident makes the whole line bad. How was the guy driving it? What is his antenna setup, swr, power, etc. etc. Could also be a poor design of a particular model. They have been offering some unique combo's.

On the other hand why not go with a TS or DaveMade that has stood the test of time?

Definitely 4 gauge minimum. welding cable is a good choice has a large # of small wire for good carrying capacity. About a 1.00 ft at home depot in the welding section.The power wire available for car stereos is better yet but costs more about 1.50 ft. from Crutchfield it has a higher strand count. Keep the ground as sort as possible and make sure the amp is connected solidly to metal for a chassis ground. An unmodified 667 will pull more than 40 amps probably closer to 80-90. If your long winded you would do well to add a battery and isolator.

I am researching VHF / UHF CB radio systems.
I am trying to build up a list of every countries "non-27Mhz" CB systems. I have a detailed account of the UK and Australia but need all the other systems worldwide. I am particularly interested in the US GMRS system, the Swiss 934Mhz band and the Italian 43Mhz band. But would be happy to learn of any others from anywhere in the world.

I need to know
Number of channels with frequencies
Modes allowed
Power allowed
whether a license is required and how to get one
any antenna restrictions
any restrictions on use, i.e. no business, business only etc.
any restrictions on installation i.e. mobile only, hand held only etc
or any other information

Please send any info or URLs for relevant web sites to
axlejack@dingoblue.net.au

Many thanks for your help and happy CBing :-)
Jack

'Doc <w5lz@oio.net> wrote:

:> Hmmm, I have found that if everything inline is working properly and you
:> are tuned correctly, SWR doesn't change no matter HOW much power you run
:> through the system. Can you elaborate on this?

: I've found the same thing. Most common SWR meters actually
: compare voltages. If the antenna system is correctly tuned
: and matched, the ratio of forward and reverse voltages are the
: same for all power levels, and the SWR is the same. If there
: is a mismatch in the antenna system, then the two voltages can
: and do change ratios, making the SWR change.

And how can this happen? The SWR does not change, no matter whether you
are feeding 1 microwatt or 1 megawatt into the antenna.

: Probably the most common reason for a change in SWR between
: barefoot radio and an amplifier is that the two output impedances
: are not the same.

If you are looking at the SWR with the meter between the rig and the
amp, then there certainly is likely to be a difference. But then you
are comparing the various impedance mismatches from when the amp is
bypassed to when the amp is active. The comparison is meaningless.

Measure the SWR at the output of the amp, and there should not be any
change, no matter whether the amp is in line or bypassed.

So simple you missed the point. The rule is absurd. One cannot legislate against nature. How are you to know if the operator that gave you that break is more than the allowed communicable distance? You can't. So you just broke the law, unknowingly and unwittingly, with no intent. Pretty ludicrous, huh? And simple.....one might add.

Well, one time I was driving south to FW at about 4 AM (I worked nights at the time, so I was awake anyway), this was the time the drug t.f. stopped me. I was asked (in this order) for my driver's license and proof of insurance, why was I out at that late an hour, what was I doing with all the radios in my car and who was I talking to on them, could I prove I was a amateur radio operator and a EMA member, had I ever been convicted on any drug charges, and would I allow them to search my car. They ran my plates and license (the agent who waited by me was annoyed that my radios picked up everything said, and told the other narc to use his phone. I was released with a warning to watch my driving (the first time anything was said about driving).

Another time I was talking on an Okla. City repeater when I passed by what appeared to be an interdiction stop. A marked OHP unit peeled off and caught up with me, then ran my plates before pulling me over. He wanted to know who I was talking to on the radio, if I'd been warning anybody. I explained I was a ham, showed him my license, and casually mentioned I'd been a police dispatcher, and did Lt. So-n-so still work in Dist. 1 (Okla. City, Troop A). After that he became friendlier and apologized for pulling me over. He was the one that explained the radio-equipped escort car profile (later confirmed on TV news reports).

Of course, I don't have A antenna on my car, I have THREE antennas. Dual-band for my ham rig, dual-band for my scanner, and a mono-band for my EMA radio.

In Oklahoma it costs $14 for Ham plates, and they give you a second plate
for the front of your vehicle (Okla. doesn't require a front license plate).
This is so you can be identified as a possible communications asset when
approaching an emergency scene (or so I'm told).

Davemade is not the best it's you who make Davemade look good by useing
davemade has the standard to all dc amplifiers it's the satisfied customers
that make Dave what he is today don't blame Dave for being ahead of the game
he worked hard and kept going forward when everyone else gave up where are
all the other so called amplifiers at now nowhere accept the copycats
imitation davemades shame on the mess. Is Davemade junk daaaaaaaaaaaa

Oh... so all he was talking about was a "swing mod"?
Negative carrier supression is a fancy name for that mod if you are
correct...

> Wouldn't be the first time that a cop made a mistake. Recently had a
> case here in Arkansas in which a state trooper arrested a guy for
> giving him a middle-finger salute.

Lese majeste! Lese majeste! -- Hang the bastard! We simply _cannot_ have
commoners disrespecting the guardians of the noble rulers! The very
idea!

> The guy won in court, so far, and
> the cop was fined $4,000, but they may appeal it later, too.

Hmmmm -- appeal? Why should they have to appeal? It's a clear case of
Disrespect of Cop, surely a capital offense, to be summarily punished by
death. The fool commoner simply did not know his place. He should have
knelt in the dirt as the King's man passed and offered to kiss the ring!
(er -- badge -- er whatever)

While it may not be "nice" to give anyone the one-finger salute, it
doesn't seem particularly "nice" to have these public EMPLOYEES
forgetting just who they work for either. Even when arresting a
difficult suspect, it's possible to be in control and polite throughout
the effort. I know: I spent a lifetime one year working in a mental
hospital, mainly as "muscle" to restrain violent forensic (murder,
aggravated assault, rape, etc.) patients. Never, ever, had to injure one
to restrain.

And I've never been especially big, 5'8" - 195 pounds.

"The finger" is not a reason to arrest; maybe to laugh at the giver's
level of discourse, but not arrest.

Very sensitive (noisy receiver) if you are in urban area. No Rf gain control
and it takes two hands to operate the extended features. It would probably
be a better radio used as a base.

Really?
well then, you have only seen the side that Jack wanted you to see.
I am not an unknown around here (and in fact, am still well known
in the Phoenix CB community).

just a little FYI, what you don't hear about doesn't mean it didn't happen.

Now, according to the qrz database, Jack recieved his ticket in 1997.
I personally know of incidents where he was on amateur radio as a
"bootleg operating station".

on other points: Mr. thurston was involved with several CB shops over the
years here in Phoenix. In all cases, he didn't stick around too long because of
complaints about the quality of his "technical work". There are at least 2 radio
shop owners that are seeking judgements against Mr. Thurston on a variety of
issues.

In the meantime, anyone that reads this will do some thinking about who they do
business with.Regardless of whether I see any return on the moneies taken from me
as a result of equipment theft, others should know who they are dealing with.

Yeah, you'd think the Arkansas State Police must be really on the
ball, if they have time on their hands to arrest "serious" criminals
like this guy. Our state must be pretty squared away if we don't have
any of those minor criminals around. You wouldn't know it from the
record number of meth labs they've busted this year. :/

COP-OUT ALERT!!! It's the old "go read the book" response.
Translation: I don't have a clue how to explain what is wrong with
your claims.

> I'm not going to waste anymore time arguing about something you
> know nothing about.
> 'Doc

I never even saw an argument from you. George laid his cards on the
table with pretty good detail. You won't even attempt to back up
your claims.

Tell us how you can measure the SWR by measuring voltage only.
I'll hook a scope probe up to my coax and you can tell me what the
SWR is.

Show us a transmitter that has NO harmonics.

Show us how changing the tranmitter impedance changes the SWR.

If you really want us to "read the book," why don't tell us where
any book contradicts his claims so we can read it?

The tape is not a problem, It holds the strips in place when the pills are out of the box, other then that it serves no real purpose. You will find this in most of the Dave Made copies as well. PW

A 667, properly operating, with a decent radio, will pull over 80 amps on peaks.

It has 5 transistors in it.

20 amps per transistor.

100 amps.

> You can not find SWR without impedances.
> Exactly like saying you cant have voltage without resistance.

OK so far. Now answer these questions:
How can the transmitter impedance affect the ratio of forward to
reflected voltage on a transmission line?
If the reflection occurs at the antenna, how can changing the
transmitter impedance change how much is reflected at the antenna?
If the transmission line characteristic impedance is 50 ohms and
the antenna impedance is 50 ohms, how can there be any reflected
voltage on the transmission line? How can you not have a 1:1 match?

> If the output impedance of an amplifier is NOT the same as the
> impedance of the antenna ~system~(feedline and antenna), the SWR
> will NOT be 1.0:1.

So you are saying that this will create standing waves on the
transmission line. How can you have standing waves on the transmission
line when there is no reflection from the antenna?

> Same with the output impedance of the radio. Impedance determines
> voltage, and that's what your measuring when you measure SWR.
> 'Doc

Standing waves are the interaction of forward power and reflected
power on a transmission line. If there is no reflected power,
there are no standing waves. The SWR is 1:1.

Now, if your radio output impedance does not match the transmission
line characteristic impedance, it will not transfer full power to
the transmission line but it does not create standing waves on the
transmission line.

You recommend pulling 1200 watts through 10 gauge?

The 667 takes approximately 1200 watts of input at full power output.

Uhh. No

What he was talking about (I think) is the same thing I was telling the group about a couple months ago.

Limit the amount of negative excursion the modulated voltage is allowed to reach.

This keeps the carrier in the "On State" for a longer period of time, and limits the amount of "Negative swing".

The 148 chassis has this and is one reason why you can see higher RMS readings from that chassis than others.

This also makes the PEP value not linearly follow the mathematical relationship... For instance, the 148 chassis that I do up (or Grant/2000/XL/etc) typically do about 8 watts of modulated AM power.

However, they only show about 12 to 14 watts of PEP power.

How do they talk in comparison? They kill the other radios... Ones that are modified to make "The Dosy go as far to the right as possible...."

>Well, if YOU were an amateur

I am, thus the origin of the message to which you replied.

There is currently no class of license called "no-code tech". There is only Technician. The license that I hold is the same license that someone who passed a code test holds if he hasn't passed any further elements. The difference is if that person passed the code before 1 April, then they can operate on a small part of 10m. Both of our licenses say "Technician".

>A 'no-code tech' still has to complete the code requirement.

Any person wishing to become a General class (or higher) must pass a 5 wpm code test. There is no requirement for code at Technician level.

Hope this answers any questions you may have and corrects and misconceptions you may have had.

"Dixon's request is inconsistent with the purpose of the CB Radio Service and could fundamentally alter the nature of the service," the FCC said in turning town the petition.

The hypocrisy in the bureaucracy is apparent. What the "gurus" at the FCC don't seem to realize is that the nature of the Citizens Band Radio Service has been "fundamentally altered" for years now. The purpose for which it was originally set aside could not be and has not been fulfilled, simply because of the nature of propagation in this range of frequencies, along with the effects of the 11 year solar cycle. Any thinking person would suspect that they established the cb service in this particular band simply to generate revenue, although there is more to the story than this. Long distance communications during periods of solar activity has been the norm in this band for as long as I can remember. It's a joke for anyone to think that they might automatically become a criminal simply because a phenomenon ocurring as the result of "nature" allows them to communicate with someone at a distance in excess of 250 miles. Let them go after the real perpetrator of this crime and send GOD a monetary forfeiture!

LOL,
Jack

He was basing his suggestion on 40 amp draw which the 10 gauge would be too
light for too. The 667 info came out in a later post.

This really is the correct order??? The Radio Shack mag mount beating out all other antennas, with the 108 steel whip and 7' Firestik the worst??? Surely the you mistakenly reversed the order.

You know, it may be a 'cop-out', or it may be that I just don't
feel like providing an education by 'pounding sand into a rat hole'.
'Coax Cop', you may not have seen an argument from me, but that's
your own fault. Read the thread. Those 'claims' are in black and
white in any text that explains how an SWR meter works. (They do
measure voltage ~or~ current, you know.)
All transmitters ~do~ have harmonics, but, if the transmitter is
designed and built correctly, those harmonics are at a very low
level (weak), compared to the desired signal. That's also one of
those 'common knowledge' things, you know.
How does a transmitters output impedance change SWR? Please pay
attention, it's not often I 'pound sand'. If you measure the SWR
of an antenna system the meter is commonly placed at the output of

the transmitter, not at the feed line antenna junction. The SWR
is a ratio of forward voltage and reflected voltage as measured
at the transmitter. If the transmitter output impedance is 50 ohms
(common), and the antenna system's impedance is 50 ohms, the SWR
will be 1.0:1 (no reflected voltage). The output impedance of the
transmitter and the input impedance of the antenna system are the
same. If the antenna system's input impedance is 75 ohms or about
33 ohms, and the transmitter output impedance is 50 ohms, then the
SWR is 1.5:1. Now, it just so happens that the ratio of transmitter
impedance and antenna system impedance follows this exact same
ratio. It isn't too hard to prove, it's almost as simple as Ohm's
law. You do have to understand what impedance is, and what resistance
is, and how they relate in an A/C circuit. If you substitute "Z"
for "R", then; I x Z = V. Since that "V" is what your measuring
when you determine SWR, I think you should be able to see that there
is a relationship between the "Z's" of the transmitter and antenna
system.
Which book should you read? I'd recommend one that deals with
alternating currents. The library is full of them. Pick one who's
'style' is easiest for you to understand. You might also review
algebra and trigonometry.
'Doc

Got a Q for ya man...

I just managed to pick up a 1953 Chevy Pickup. Got a 427 Rat Dual Quad
with Holley 550 double's on it sittin on an engine rack in the garage.
I was thinkin 'bout puttin the RAT in the Chevy (Where it belongs!)
How many alternators do ya think that badboy will run? ::grin::

And no, this isn't a joke. I'm thinkin I wanna build a talker.

Suggestions?

well you must be smokin dat hawaaian hooch again. you know, i hear
there isn't a whole lot to do on the islands and for a grown man to sit
in his jalopy for countless hours on a saturday night , constantly
repeating his handle over and over and over again. well, i am thinking
that what i hear is right. to each his own i suppose, but the most and
i do the mean the most talking i would ever do on the radio is for a
few precious minutes here and there. there are far too many other
things to do. tell me modsquad, what kind of work do you do? i am very
curious. i certainly do hope that i don't have to share some of my hard
earned money to allow you to talk on a radio all day. anyway in the
days of my grandfather, even then, there was a saying , you don't work
you don't eat and you know what, it was a reality. but now , we got
lazy boys talking on a radio all day instead of working . but i will

tell you what modsquad, i have a opening for a shoe shine boy at
cd,inc. so if you need some extra gas money let me know. i will send
you my boots and i want these luchese's to be spit
shined ,boyyyyyyyyyyyyyyyyyyyyyy,.....cd is out.....

Hey Cb'ers,
Forget those whip's and large coil antennas. Put an Antron 99
on the back bumper.....works like a fucking charm! The only
problem I can see is, it gets a little annoying when those
damn concrete chucks rattle off the roof when you knock 'em
outta the overhead bridges. Not only does it work great,
but all your friends and neighbors will think you finally got
a job with one of them fancy escort services for oversize loads.
Contact Blutarsky for mounting method.

Thought that was the case, but needed to check it out in case I was missing something. I was all set to buy a Wilson 1000 mag mount based comments I read here on the newsgroup, where upon I stumbled on some antenna evaluations that indicated that a top loaded fiberglass is vastly superior to anything but 108 whip. My radio will be used 99% for just the regular 40 cb channles and 100 watts max, if that. Am I picking nits here? Will the difference be discernable comparing a Wilson 1000 to a 4' or 5' Wilson fiberglass or Firestick fiberglass, both also on a mag mounts. I am obsessing a bit on this antenna issue because I know its the single bigest factor in getting the best performance from your radio. TIA everyone. Nick

> measure voltage ~or~ current, you know.)

Give me a book title and page number that explains how an SWR meter
reads SWR by only measuring voltage. It can't be done.

And here's another challenge along the same lines.
I'm measuring the voltage on my transmission line. I get a
reading of 14.14 Volts RMS. OK, what's my SWR?
I measured the voltage (which is what you claim that SWR meters
only do); now give me my SWR.

> All transmitters ~do~ have harmonics, but, if the transmitter is
> designed and built correctly, those harmonics are at a very low
> level (weak), compared to the desired signal. That's also one of
> those 'common knowledge' things, you know.

The overwhelming number of power amplifiers out there have minimal
circuitry to reduce the harmonics. In fact, most of the newer ones
have very broad-banded toroidal core output matching circuits which
do almost nothing to eliminate the undesired harmonics. Despite
this, I do not consider them to be "built incorrectly."

> How does a transmitters output impedance change SWR? Please pay

OK so far.

> If the antenna system's input impedance is 75 ohms or about
> 33 ohms, and the transmitter output impedance is 50 ohms, then the
> SWR is 1.5:1.

Now you're wrong. Name one reference that defines SWR as a function
of the transmitter output impedance. I agree that you have a mismatch
between the transmitter and the transmission line but there are no
standing waves on the transmission line as a result.

> Now, it just so happens that the ratio of transmitter
> impedance and antenna system impedance follows this exact same

I understand impedance thoroughly and you have said basically nothing
here. You have shown no relationship between antenna impedance and
transmitter impedance.

> 'Doc

I've read plenty of books. Why don't you find me an excerpt that
indicates SWR is a function of transmitter output impedance?
I guarantee that you cannot do it.

what kind of clearance do you have for that big block engine in that

compartment? big block is a good way to go. lots of torque. once you figure out the spacial problems then you can do the brackets thing. but it would be a good idea to do that before you place engine in frame. just jerk off all that stuff on the front of that engine and go from there with oh, how about 3/8 inch steel plate will do. how fond are you of a/c system? if you don't need it , then remove it . if you want it then work around it. how many alts are you going to run? remember, one hp equals about 750 watts. all depends how big you want to go, but if the bottom end of that engine is cool , then you can use bolt on stuff for hp increase. the less that engine has to work to run the alt load the better it will be and the less noticeable especially when you key up, just a thought,.....cd is out......

Hi, I have a Heathkit SB 200 amp that is giving me a bit of trouble. The internal relay is the problem. As soon as I turn the main power on, the relay pulls in and I don't believe that this is the way it should work. I'm using it with a Yaesu FT-757 with the external relay device. It has no output right now and is stuck in the transmit mode when the power comes on / relay pulls in. Does this make sense? Please let me know if you can help. Marc.

Does the 200 relay pull in with out the 757 connected to it?
If so then you have a short in the relay plug or relay input
wring.

Yes the relay pulls in with the radio and external relay box disconnected. I kind of figured it's a short some where, I was just hoping someone else had run into this problem and could tell me where to look. Thanks, Marc.

Well, i believe it's a fairly simple circuit. Just visually inspect
the solenoid wring all the way to the plug in the back. If you
have a ohm meter try that also. Neither solenoid wire in the plug
should be grounded to the chassis.

Ok. I'll run through it again. I tried this and couldn't seem to located anything that looked strange or tested strange with an ohm meter. I'll try again. Thanks, Marc.

Andy,
You thoroughly missed my point. Please read Section 97.9 (a).
Beyond that, my point was that there was a massive reorganization of license requirements. Under the old rules a holder of a Technician was required to hold credit for 5 wpm code, and had credit for his Tech license which eventually evolved to the same written requirements as the General. Hence, when the Tech Plus license was created, the old Tech became a Tech Plus, either by default or by request for a new paper license from the Commission. With the recent reorganization of license classes, this same Tech/Tech Plus was able to upgrade to General merely by filing the appropriate paperwork. This is not to suggest that Technicians licensed after late 1987 were able to do the same thing.

Agreed, If they only measured voltage or only current for that matter the meter would have to be located a a voltage node and at an anti-node to measure SWR.

>> and reflected) are the product of RF current and ~system~ impedance.
>> You can not find SWR without impedances.
>> Exactly like saying you cant have voltage without resistance.

SWR is not the relationship between forward and reflected voltage. It is the relationship between forward and reflected power. It is the relatioship between voltages measured at voltage nodes and anti-nodes. It is the relationship between current measured at current nodes and anti node. It is the relationship between impedance of the line and impedance of the load. Any SWR meter that you do not have to move in the line from node to anti-node calculates SWR by measuring POWER. POWER is both CURRENT and VOLTAGE. Power is what directional couplers measure, not voltage or current alone.

Yes... that hokey tape is really bad!
I have never seen such techniques used in commercial electronic equipment.
It's a horrible way to construct something electronic... very "back alley"
at best.

One of two problems exist

Your external relay box is broke

Your amp is wired up incorrectly.

Disconnect the wiring from the external relay box.

Does it still stay keyed? If so, amp is faulty.

If not, then try manually keying the amp (PTT to ground, if memory serves me well).

If that works, then the relay is good

At this point, you need someone who can figure out what is wrong. It is elemental electronics, and if you don't understand it well enough to figure it out yourself, I recommend finding someone who does.

> in the same box?

No.

In other words, why is it called
> a 3 button Texas Star mod

Because it is a Texas Star Mod(ulator), and it has three buttons on the
front of it.

If ya wanna see a pic of one, look in the catalog at the Modulator Plus.
That is the "3 button TS Mod"

rather than being advertised
> as two separate amps that are being used together?

I got it, knowing what a 3 button Texas Star Modulator was. Experience with
the different amps I guess????

Yes, your right.

Welcome to the clean signal / low efficiency of a biased amp. On a
transistorized biased amp, you will see about 30 percent efficiency.

On a no-bias amp (grounded base) amp, you will see about 50 to 55 percent
efficiency. No matter what your wattmeter says.

Their is no substitute for having enough alternator to power your station.

Motor Mauls add convenience. They don't make up for deficiencies in
alternator / battery systems.

For sale: RCI-2950 in excellent condition and never used mobile.
I am the original owner and a non-smoker.
It comes complete with all hardware, the manual, and the original box.
Frequency coverage is 26 through 32 MHz.

The price is $180 shipped to the continental 48 states.

Money order, cashiers check, or your VISA or MasterCard through PayPal.

For pictures and info, go here:
http://www.louisacomm.net/~bwilke/2950.html

Interested or have questions? Please email direct at: bwilke@louisacomm.net

If you click "reply" in your news reader, you must remove the "REMOVE_THIS"
from my address. Thanks.

> know if you can help. Marc.

Marc,
If your sure that the external relay isn't the problem, there are
two possibilities. There is a short to ground somewhere in the keying
circuit, or, the relay is bad. There are a couple of things that
could
be wrong with the relay. The activation coil can be bad, or the
contacts
can be 'welded' together. The 'welded' contacet can be corrected, but
if that's what it is, you might as well replace it.
'Doc

The digital RS meter was a neat little meter, kinda hard to get used to, you know not having a needle to watch but pretty accurate nonetheless.

They may be built 'correctly' but they are ~all~ dirty if they
have no filtering on the output. They may not do anything to
filter harminics, but that isn't good design, is it?

LOL... re-read what you just wrote! I don't need to quote a
reference, but I'll tell you how to check on your own. Find a
50 ohm dummy load, add a 25 ohm resistor in series. Check the
SWR on the 'new' dummy load. You'll find that the SWR is going
to be around 1.5:1, and the only thing different is the input
impedance of the load. The output impedance of the transmitter
and the load input impedance is now different, you do have an
SWR present. I x Z = V is still true.

You can never have to large of gauge wire.
I don't care if it's only drawing 50 amps, go
with the largest wire you can fit. I run 0 for the
power and 2 gauge for ground all through the
truck. And you can never have to much ground.

Source record: 50187

Not a feature of the amp, likely a shorted wire, cap, relay coil or tube grid ground.

Note the SB-200 Relay wire also supplies negative cutoff bias to the 572B grids via R-15 when open
It is possible a tube with a grid shorted to the cathode will close the relay.

Beware: the voltages *will* kill you if you get hit a certain way !
Do not operate on 11 meters

I wouldn't bet on that, (and who's talking about feeding an
antenna
through a few thousand feet of lossy coax to start with?). If you
use a reasonable length of feed line, then have a 3:1 mismatch at
the antenna, the SWR will be no where near perfect.

Then, there is a mismatch. Resulting antenna system impedance
would probably be around 120-130 ohms.

> By your claim, the SWR is 1:1. Hook up an SWR meter, and you will

Actually probably nearer to 3.0:1, but in either case, it wouldn't
be what I'd call acceptable.

FireRadio@webtv.net wrote:
>
> Ok Bill thanks for the information. The only thing i don't understand,
> is the Negative feedback.

With common emitter amp stages the output signal
is inverted; so, if you feed a portion of it back
to the input, the gain is reduced (which improves
stability), and the amount of distortion is lowered.

A negative feedback loop is a cap, resistor, and
sometimes inductor combo that goes between the
collector and base of each transistor. A simple
and effective loop for the 2970 and other amps
is a .1 uF, 25 volt disk cap and a 33 ohm, 2 watt
non-inductive resistor. The cap blocks DC, and
the resistor value sets the amount of feedback.
Lower resistance equals more feedback and vice
versa. Most loops use 100 ohm resistors. I've
found that you can employ quite a bit of feedback
before there's a noticeable reduction in gain.
That's why I go with 33 ohms rather than 100.
Negative feedback is a very effective tool for
cleaning up dirty and unstable amps.

Okay, I misunderstood. I was picturing a cookie amp with some
type of modification that involved the addition of Texas Star
switches and other circuitry. It was the wording of the ad
that threw me off.

Eeeeyeah. Special license plates in New York State are $150 extra each year. Amateurs too. Not really an option for most.

I still have a problem being stopped by the police just because I have the wrong length antenna on my car. The Supreme Court gave these guys powers to search vehicles on the slimmest of pretexts.

For awhile around me the cops were monitoring CB channel 19 and whacking folks that warned oncoming traffic of the speed traps. They found a hooker ring operating around one of the truck stops running on 19 too.

>
There is a fair amount of truth as far as the distance. I think they
just didn't want to ENCOURAGE more high power stations. I did work
some 10,000 miles on 15 watts once - from Guam Island to Webster, NY.
The skip was fantastic; my signal was weak but readable. However, I
was on a TH6DXX (6 element beam with, I believe, 4 active elements on
10 meters) up 102 feet over salt water. I think, from talking with
some coworkers, the problem is that you end up needing a small linear
just to talk 10 miles locally since the channels are likely heavy with
interference (likely many of the non-local signals are 100 watts or
more). One gal can talk to her husband near 20 miles while comming in
to work (at 4 AM). Getting out of work, at 6 PM, forget it. Much of
it is in Spanish (or Portugese) and is unlikely local interference and
also unlikely starting out as a 5 watt signal. Of course, if they
raised the limit to 200 watts, then there would be far fewer DX signals
capable of causing local interference simply because the fellows
running 500 or 1000 watts would have to increase to 20,000 watts -
quite unlikely given a nominal 100 to 150 amp 240 volt service to a
house. Then again, on the other hand, you'd probably have a ton more
operators trying to work DX. Kinda like which came first, the chicken
or the egg? The people trying to maintain local communications would
probably be back down to 5 miles at most.

> power.

On the contrary, you are a little short on the facts.
There is no way to sample only voltage and provide a directional
power measurement. Both meters, "garden variety" and Bird, sample
both voltage and current. The forward voltage and current are
in phase and contribute to a power reading. The reflected voltage
and current are out of phase and cancel each other out and, thus,
do not contribute to the forward reading.

This simultaneous sampling of voltage and current is inherent to
the design; it does not require two circuits. The sampling mechanism
is both capacitively coupled and inductively coupled to the
transmission line; this allows sampling both voltage and current
with a single mechanism and circuit.

The Bird meter only displays watts and does not provide variable
sensitivity to render a direct SWR reading. This does not mean
that it uses different technology to perform the measurement.
Geese, you'd think for all that extra money they'd give you more
functionality; not less.

Since you think you are so smart, why don't you correct me and
tell us the exact difference between a Bird meter and the "garden
variety." I'm waiting.

I don't need to know exactly what the forward and reflected power is
to know the SWR; I only need to know the ratio. That is what SWR is --
a ratio.

When someone asks you what your SWR is, do you answer "4 watts forward
and 0.5 watts reflected?" (In your case, maybe you do). Any normal
person would simply provide the ratio. That is all you need.

Yes they are.
There is no way to sample only voltage (or current) and provide a
directional power measurement. SWR meters sample both voltage and
current. The forward voltage and current are in phase and contribute
to a power reading. The reflected voltage and current are out of
phase and cancel each other out and, thus, do not contribute to the
forward reading.

This simultaneous sampling of voltage and current is inherent to
the design; it does not require two circuits. The sampling mechanism
is both capacitively coupled and inductively coupled to the
transmission line; this allows simultaneously sampling both voltage and
current with a single mechanism and circuit.

> ...With properly designed and constructed amplifiers there shouldn't be
> any harmonics or parasitics though.

Every transmitter has harmonics in the output. It is a reality.
HIgh power transmitters generally have significantly more harmonics
than low power transmitters. It is next to impossible to operate
high power devices and get the linearity found in low power devices.
These non-linearities create harmonics.

> If the output impedance of an amplifier or radio is 75 ohms instead
> of 50 ohms, for example. And the antenna system's impedance is 50 ohms,
> then the resulting SWR is going to be at or very near 1.5:1.

No, that is not the case. SWR is independent of the transmitter output
impedance.

> If the output impedance of the radio or amplifier is 50 ohms and the
> antenna system is 50 ohms, the SWR is then 1.0:1, or very close, isn't it?

Definitely.

> Of course impedance can affect the SWR readings.

NOT!

Not necessarily. If the coax is 75 ohm, then you have about a 1.5:1 SWR.
I am sure that you were assuming 50 ohm coax, since the rest of your posts
on the subject have been correct.

> the ability to calculate swr not a common swr meter at all.

TheGame,
Had a 'blonde' moment there, don't know where that 'VSWR' came
from...
Nothing's really changed with the Bird in probably 30 years. There
has
been quite a change in the 'common' watt/SWR meters on the market
though.
Overall quality and accuracy has improved.
Name a few? Daiwa, Autek, Kenwood, MFJ, Commet, and who knows how
many more. Do they use 'plug-in' elements? No, but for common use,
who
needs them. I don't worry about very low power, and I don't worry
about
measuring very high power, so don't need that capability. Most CB'ers
or
hams don't need that capability either. Do I need accuracy to within
1%
of full scale value? Nope, sure don't. Do most CB'ers or hams? I
seriously
doubt it. Do I want to spend something on the order of $400 for a
watt
meter? Not hardly! Rather spend it on something more useful...maybe
beer.
Do I care if someone has a 'prestegious' Bird on the shelf? Answer
that

for your self...

3699. Re: Texas Star 500 questions-need a GURU!

Source record: 50101

Professor,

Look into the mod for adding variable power to am single final radios. The modification bible and other publications list a circuit that goes between the carrier amp and the collector junction of the driver to final. Some of the newer rigs incorporate this type of "mod" in their design.

The mod I mention uses a TIP120 or similar transistor to allow the signal to the outputs which contains the audio info to be manipulated in such a way that the carrier is greatly surpressed while the output retains it's same peak value. It shows up as a wider "swing", with the peak output being equal to what was produced with the higher stock carrier configuration. The end result is more forward "swing" is developed and the audio seems to have higher amplification.

If you do this mod, the first urge is to set the carrier down way low and show nothing but swing. It is best to look at the waveform on a scope and set the carrier to the lowest level that can maintain a sinusoidal wave; around 2 watts. It can be set to give unmeasurable carrier with maximum peak power deliverable by the final transistor used, however it is very hard to understand as the waveform is too distorted. It would be nice to think of it as a way to get high level audio with out exceeding 100 % modulation. If is best to have the audio limiter circuit enabled if going this route, as the cleaner the waveform going out, the better the waveform on the out....

If you think of it as moving the reference line of the audio sinewave "down" into what would normally be viewed on a scope as the negative part of the sine wave, the percentage of negative modulation is decreased. "Backswing" is created when the negative modulation percent is greater than that of the positive peaks. This allows the percentage of modulation to stay within 100% (in theory) while developing a greater forward swing, in proportion to the positive to negative peak ratio.

This is a very poor technical description, but I think is the type of mod that you are looking for. I have been playing with the idea, and giving it some thought, and am still in the info gathering stage; I don't fully understand all I know about it so far, and have no problem in admitting it. Bill's am tutorial has a very good overall description of the negative percentage relationship to "backswing", and from it I was already considering the possibility of "phase shifting" as a means of lowering the negative peaks, but compressing them would yield the same outcome.

Look at a schematic for a Cherokee CBS-1000, which is actually an Albert AE-497 derivative. You will see that Q71 is a 2SB824, and is listed as an audio mod amp. It is a transistor that can be used for audio or power out up to 50 MHz and has a max dissipation of 50 watts with a Max 10 amp draw. It

is probably close to an example of what the design would be in a multimode rig.

I always looked at it as a way of increasing the audio power on the RF line after the modulation transformer to allow a higher level of audio amplification and power than the transformer could handle without overheating, but I believe Bill put a better label on the concept with the idea of negative peak compression. If you can move the base line low, the average peaks will be higher......

Just a thought.....

David

Sure it's true! SWR is the relationship between forward and
reflected
voltage. The voltages being compared are a product of RF current (I)
times
the impedance (Z) in the circuit. In the antenna ~system~ (feedline
and
antenna), the voltages (forward and reflected) are the product of RF
current
and ~system~ impedance. You can not find SWR without impedances.
Exactly
like saying you cant have voltage without resistance.
If the output impedance of an amplifier is NOT the same as the
impedance
of the antenna ~system~(feedline and antenna), the SWR will NOT be
1.0:1.
Same with the output impedance of the radio. Impedance determines
voltage,
and that's what your measuring when you measure SWR.

I think you need to go read some more. Do a little thinking.
Maybe
review A/C circuits, definitions, etc. Because if you ever knew any
of
this stuff, you've evidently forgotten it.
I'm not going to waste anymore time arguing about something you
know
nothing about.

Oh, I was only going to go with 2 or 3 alt's. I wasn't planning on
running more than 1500, and then only on good skip nights and for
shootouts. I usually run legal or less, on a daily basis.

Plenty of clearance in the engine bay, provided I remove some
sheetmetal from the fenderwells, etc. I'll be able to shoehorn it in
there, I think.. If not, I can always build up that 4 bolt main 350
block I have in the garage.

::shrug:: I'll make it work one way or the other.

3709. Re: Coax Jumper Length to Amp-Need a GURU!

Newsgroup: rec.radio.cb
Date: 2000-08-29 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000829043911.02701.00000512@ng-fi1.aol.com>
Source record: 50238

What happens when you change the length?

If the SWR on the line is 1:1 nothing. Make the damned thing anylength you want

First of all the SWR on the coax will always remain the same regardless of how long it is, this is of course ignoring coax losses. Since you are not planning on putting 500 ft of coax in the trunk of your car this is pretty safe to do.

The impedance seen by the radio will not always be the same unless there is a 1:1 SWR on the line. If this is the case the impedance seen by the radio will always be the same. Usually it is not. Lets say the input of the amp is 25 ohms connecting 6 ft of coax to the amp will make the tx see 100 ohms. Perhaps your transmitter will like working into 100 ohms better than 25 and give the amp a little more drive. Then again maybe it doesn't. This just depends on the nature of your radio.Increasing the length of the coax on to 12 ft will bring you back to 25 ohms resistive again.
Between 25 and 100 ohms resistive there are an infinite number of complex impedances that contain both resistive and reactive componets.All of these will depend on the length of the cable. Your radio may even like one of these better than it likes 25 or 100. Then again it may not.

Most likely though the input impedance of your radio is complex. If you start adding coax there will be two spots were the radio sees a purely resistive load. One of these may be the place to hook your radio, but then again maybe not.

The best setup may or may not come with any particular length, You may need to change the impedance of the coax jumper to get the best match or you may not need to do anything at all.

Yes changing the length of the coax can change the way your amp and radio oprates together, but it may not.How it will effect the operation depends on your radio and your amp. There is no pat answer on how long to make the jumper or even what to make the jumper out of. It may work best with 50, 75,or some other impedance coax. You just have to try. This is why I say screw the coax and put a little cheap antenna tunner between radio and amp and tune for best output. If you really want to mess with e coax though you can make up several short cables. Make one each 3 inches, 6 inches, 12, 24, 48, and 72 inches. Then play with different combinations until you get the best performance of your amp.

3710. amp swr problem

Newsgroup: rec.radio.cb
Date: 2000-08-29 00:00:00 UTC
From: G SEVEN <superiorwavelength@prodigy.net>
Message-ID: <8oftee$16nk$1@newssvr05-en0.news.prodigy.com>
Source record: 50239

Ran into a weird case of high SWR on a 16 pill rebuild the other day. For some strange reason that I can comprehend I cant get the SWR to go down. Its just pegs the corner its so high. I tried to rewind the transformers with different wrap schemes, I put a air tuner on the out put antenna side of the amp, I even by passed the relay so that it would go strait throughout the amp. I even tried to break it down to half the amp to see if there was a problem with one side of the amp by having it just go through 8 pills instead of 16. I checked all the parts to be good, I checked every thing and I can figure why the SRO is so high, its kicken my ass. Its like its a dead short.

Its got me baffled, has any one ever run into a problem like this? The only weird thing I could see with the amp was it had the input transformers grounded, I changed it by using chokes to keep it above ground. Also the B+ is tapped strait to the transformer with out any ferrite filtering. Also the combinors look kind of questionable as far as the composition, I suspect they are using a Iron material other then common ferrite. The donuts are on the heavy side. Could any of this cause a high SWR if it is the wrong material with the wrong amount of wraps? There using seven now. I dont know, has any one encounter this kind of problem before?

KRS

3712. Vehicle grounding question

Newsgroup: rec.radio.cb
Date: 2000-08-29 00:00:00 UTC
From: Waterbug <waterbug@hawaii.rr.com>
Message-ID: <6gLq5.16896$d4.65896@typhoon.hawaii.rr.com>
Source record: 50241

How important is it to properly ground your vehicle?
Would I have to ground the muffler, transmission, transfer case, pickup truck bed to the frame of the vehicle for better peformance? I own a pickup truck with a antenna mount on the roof. Check this out.. when I grounded the frame to the pickup truck bed, my swr changed? How is that possible? Does the antenna now see the "extra" ground thus including it in the overall "ground plane" of the vehicle? Is this reading false? What is the difference in grounding the pickup truck bed with woven ground straps -vs- welding cable. Someone please set me straight. No one outside of this newsgroup seems to give me a solid answer. Please help.....
Thanks!

> Thanks!

Waterbug,
Grounding is important, but I'm not sure I'd go to all the
trouble of grounding 'everything' under the truck. If it isn't
grounded, I would ground the bed to the frame. Maybe make sure
the motor is grounded to the frame, and wait to see if I thought
I needed to ground other things.
The ground (truck) is the other 'half' of your antenna. The
antenna it's self being only 'half'. If you change 'half' of
any antenna, you are going to see a change in SWR. If the truck
bed, for instance, wasn't grounded, the antenna would 'see' it as
a near by object, not part of the antenna system. So your reading
is not false, as long as you took the reading correctly.
I wouldn't recommend using braid for a ground strap. When it's
new, braid works well. But, after a time, the weather causes the
copper to corrode and then 'rot'. That will give you a ground
that changes value over time, and that's not good at all. It would
make your antenna gradually change over a period of time, and you
really don't know why. If you put 'ends' on the welding cable and
seal the exposed wire, it ought to work great. Kinda expensive
compared to other things but it would sure work. Flashing, the
copper, or aluminum kind, works well, is cheap, and almost any
hardware store in the world has it.
Good luck...

The only time grounding of the transmission and tail pipes is needed is
when you are getting rf in the ignition system from down below.
Sometimes grounding the hood will stop this problem also.

What I am trying to say is the tape is under the strips (power) and the tape is there to hold the strips (power) in place when the pills are out of the box, without the tape the power strips, transformers ect. would only be held in place by the 10 ohm resistors and the micas. please read it again, maybe I didn't put in a manner that it was easy to understand, I apologize

>> >The tape is not a problem, It holds the strips in place when the pills are out of the box, other then that it serves no real purpose. You will find this in most of the Dave Made copies as well. PW

3737. "Trash Can 6000" Homemade Mobile Antenna

Newsgroup: rec.radio.cb
Date: 2000-08-29 00:00:00 UTC
From: The Phoneman <phoneman01@hotmail.com>
Message-ID: <01c011cd$60a88a80$82878685@clip>
Source record: 50266

It's the newest concept in mobile antenna's....works great
and cheap to build too. Guaranteed to take up to 50K for
as long as your Skull Cracka can crank it out. Simple building
components consisting of (1) Full Size Aluminium Trash Can,
(1) Copper Ground Rod and (30) gallons of Used Motor Oil.
Instructions: 1st mount the can to your roof or trunk lid using
(4) self tapping sheet metal screws. Fill with motor oil to within
6" of the top of can. Put on lid. Drive 8 ft copper rod thru center
of lid making sure to go clean thru to bottom of trunk or floorpan
if roof mount. Be sure to apply silicone first so no leaks. Hook
ground wire to handle on can and center conductor to copper rod.
No SWR tuning necessary. This is a real eye catcher too!
Guaranteed to blow the hell out of all those nasty expensive base
loaded junkers!!!!

3738. Great Article on Alternative DC Power Supply

Newsgroup: rec.radio.cb
Date: 2000-08-29 00:00:00 UTC
From: Matt Deremo <mderemo@mpowernet.com>
Message-ID: <8ogm8o$6jt@dispatch.concentric.net>
Source record: 50267

Folks,
I've needed a replacement 12 VDC power supply for my mobile/base setup for about a week now. Since I work with computer hardware, I thought why not pull the power supply out of a scrapped computer case and use it. I was unsure of the various voltage and amp specifications, not to mention what wires carried what. I found this little gem of an article which documents the whole process.

I set this up last night and it works like a charm!

This could save you some big bucks. I had the scrapped computer case in my junk box, cost $0; sweet! As the article states, you can find junked cases at any local small computer shop ranging from $5 to $50. The older the PC, the less it's worth. This can be a big savings since a new 25-40 amp power supply can be $200-$300.

Hope this helps.

It is the sum of the forward and reflected voltages. This is all
you can measure if you only measure voltage. There is no way to
separate the two without measuring current.

Yes that is what they seem to say and I don't blame you for buying into this. They further explain it in their antenna book. The handbook references this as the better explanation. See 15th edition page 27-8 of the antenna book under the paragraph headed "Design Philosophy". The antenna book only states that both current and voltage are part of it and how they are vectorly combined. For our argument's sake this is enough .

It is a misconception that a reflectometer somehow separates the forward and reverse componets. It does not.

When in the "FORWARD" configuration they are able to capacitively measure the ALGERBRAIC SUM of the forward and reflected voltage at the point where the device is inserted. It also measures the ALGERBRAIC SUM of the forward and reflected current inductively at this point in a like manner. It then using Vector addition combines the current and voltage to give what many oversimplified explanations call forward voltage.

In the "Reflected " configuration the only thing you do different is you are using VECTOR subtraction of voltage and current instead of addition of these two values. This gives the "reflected voltage".

At any given point on the line there are only two componets, the ALGERBRAIC SUM of the of the forward and reflected currets and the ALGERBRAIC SUM of of the forward and reflected voltage. These can not be separated into their forward and reflected componets. The meter can either vectorly add these two values or subtract the current and voltage sums giving what a lot and apparently most text call forward and reflected voltages.

The references you gave in the 1969 and 1999 books are for a construction projects. You cannot expect them to go indepth on the subject. You should read the theory sections sometimes. Check mine.

You don't need any current to have a voltage (but I'm getting off on
a tangent here).

> There is a direct
> relationship between impedance and voltage in a feed line. SWR is a
> ratio of forward and reflected voltage,

OK so far.

> the ratio of source and load
> impedances have the same relationship.

No they don't. There is no relationship between the source and
load impedance.

> I can't think of any way to
> say it that's more simple than that.

There is no factual way to say it; it isn't true.

> You probably won't find this stated
> in exactly the same way in any book,

I know I won't.

> ...it does require some thinking.

Why don't you walk us through that thinking process? All of my
thoughts contradict your thinking. And I haven't found anyone
else agreeing with you in this thread.

> Try the "handbook", it'll give you the theory, the thinking part is
> up to you.
> 'Dco

The handbook has a lot of formulas for SWR. Why don't you give us
the one (that isn't there) that shows SWR as a function of transmitter
impedance? The handbook seems to confirm my thinking; not yours.

One solution might be to allocate a number of channels up on UHF for
local communications. This way, everyone could have a 10 mile range or
so mobile to mobile and more to a good base. This would be pretty much
interference free as there would be little or no skip to contend with
(although there IS tropospheric bending with some resultant dx). Then,
those who want good local communications could go to UHF (and keep
their HF system too) and THEN relax the regs a bit. It would certainly
allow much further range than FRS does and almost everyone would be
happy!

Actually,
if an amplifier has the proper matching circuits
(and is tuned for the band of operation properly)
there shouldn't be a need to using the "coax
impeadance transformer" method.

The same goes for a proper antenna.. length really
should not matter.

Well,
without a descent schematic, it would be very hard to tell whats going on.
However, it may be that a cap has dead shorted on you or your modifications
have revealed the presence of a design flaw.

There may also be the possibility that you managed to set up a solder bridge
somewhere. your best bet, get a sig generator and a scope and see where things
get interesting.

Um... I ::could:: be wrong, but if a radio is set up to transmit over a 50 ohm impedance, and the impedance of the antenna system (coax and radiator) is of a different impedance (say, 300 ohms), the SWR will be poor. Conversely, if a radio is set up to transmit over a 300 ohm impedance, and the antenna system is set up for 50 ohms, wouldn't the SWR likewise be poor?

Just my two cents...

ok now i know cd is gonna say something about me being in chicago but, I run a 1 driving 4 base amp from x-force on an antron 99 with very flat swr. I beat the shit out of that box and it still does the same numbers it always has. Listen to it every now and again on 11 or 6. Modsquad heard it. How bout it Mod was 937 crankin last week in the mini grass??. This is just an opinion but before you are all so quick to jump on the amp builder bear in mind that not all "installers" are so perfect either. I am sure that dave and foxy and whoever else find their boxes blown up and the people are always so quick to blame the box. Try tuning your systems before you hook your shit up!!!! I've even hit that box with a 30 watt dead key just to be a dick and throw a dead key on someone..LOL..guess what??....it still works just fine....

937 in chicago.....

That's one proposal that might even reduce the numbers of outbanders should it be implemented. There have many suggestions and proposals to the powers-that-be over the years concerning ways to improve band allocation and service related issues. The FCC are so beholden to their own special interests and caught up in so much hi-tech crime related issues that the bands are the least of their concern. I was quite frankly amazed when Hollingsorth stepped up enforcement since his appointment. They have neither the resources (IE: manpower, money, time) nor any REAL convictions toward serious enforcement of the airways UNLESS it's a safety issue...and that can mean anything they say it does, including popping your local pirate station who has been running at 2 watts FM but the local corporate station filed a complaint stating they were interfering with their remote broadcasts (even when they were not). The only change since Hollingsworth's appointment has been more publicity concerning his "enforcement" actions which consist of warning letters and the occasional token fines. There is so much unused bandwidth available and with the Feds. auctioning that space among all other clusterf*cks they have their hands into, they really don't give a squat about cb'ers, or hams, for that matter.

Body handling: HTML body converted to readable text

That is an action you can refrain from TR. Skip happens and that's it.
It's not concrete. There is this fine line because no one knows if the
communication is an "illegal" one or not. Hams have rules that make sense.
Operate here and use this much power. It doesn't say who they can and
cannot talk to by distance, just that the other side needs to have a valid
license. Touching people inappropriately is not a very good analogy cause
you can control what your body parts are doing. You can't control how far
your radio signals go. Just how much power you use and how high your
antenna should be.

Yes indeed, but the results would be different. A transmitter 'looking up' at a load will more than likely simply refuse to come up to full power against a higher-than-designed resistive load. Not a big deal. A transmitter 'looking down' on its load will try to pull power of nowhere and trip the protection circuitry (best case).

You see this all the time in audio when yonocks wire a dozen or so 8 ohm speakers in parallel and hook it up on the 16 ohm output ''cause it's louder'. The bass goes to lunch.

Similarly, a capacitive load (antenna too short) will often trip the protection where an inductive load will usually just cause some power reduction. This case is a bit more complex so no guarantees. This is, by the way, why any reading in a line from an amp that does not contain a good lo-pass filter may as well be take from the local phone book.

The moral to the story is that a high VSWR is interesting but not in itself much of a clue to what is really happening. When the load is non-resonant for some reason, whether you measure your VSWR with a Rat-Shack special or a gold-plated Bird and read 'real' SWR really doesn't make you a whole lot more able to fix the problem.

Given that your finals and power supply will handle it, the right way to tune is to start from the lowest SWR and tweak for maximum field strength; they are rarely the same tuning point.

VSWR is a symptom, not a religion.

It is usually pretty darn close if the antenna was designed for 50 ohms. But if the antenna is not 50 then you are right. What most people dont understand is that if the SWR is good enough that you dont have to worry about it indicating something is wrong with the antenna then it does not matter very much what it is. If you were feeding a dipole with 50 ohm cable you would expect a 1.5:1 SWR. If the SWR read 1:1 then you would expect something was actually wrong, like a lot of loss in the coax. Like you said SWR is a symptom, it may or may not mean anything good or bad. The only bad thing about a high SWR is that coax does not work well with it. Coaxial transmission line losses increase fairly rapidly with SWR. This is not the case with open wire line.

Hello, saw some recent posts about base antenna and thought I might share my recent experiences with my homemade dipole.
Decided to put try a base station to use an extra radio I had laying around (Uniden 66 stock).
Made the dipole with help from some beginner ham book from RS. Supplies were Antenna wire (got a 70 foot roll of copper braid antenna wire from RS for $7 bucks) and coax (got 50 feet of coax from RS for $14 bucks). Made antenna according to directions.
Then put antenna up.

Location #1 - One end of dipole at ground level, the other was attached to wooden deck about 12 feet in air. I guess they call that a sloping dipole. The best SWR I could get across board was around 2. Reception was Ok, but was not able to make any contacts.

Location #2 - Decided to try roof. Nailed one end of antenna to the bottom of roof, nailed the other end up near the peak of roof so it was sloping again. About 20 feet on low end and 25 feet at high end. Ran the coax down to the gutter and down the gutter drain to my bedroom window in the basement. SWR was not on the scale, way too high. Changing antenna lengths had no effect. Reception was worse than in Location #1. I was able to transmit to a mobile at about 4 miles away with myself barely audible. Perhaps the antenna touching the roof accounted for the poor SWR?

Location #3 - Ran antenna along the peak of the roof, about 30 feet in air. Suspended antenna wire about 15 inches off surface of roof. Still ran coax down to gutters and down drain spout to bedroom window. SWR is 1.2 on 1 and 1.4 on 40. Reception is fantastic. Haven't been able to transmit yet, but am expecting good things. Especially for $21 bucks.

Couple quick questions.....are dipoles directional at all? and if so, in what direction to the wire?
also anyone see anything I can do to improve the performane?, keeping in mind I can't go any higher. Would something like an Antron 99 give me any better performance?

Ok, Thanks for any comments, questions are welcome.

snip
>Couple quick questions.......are dipoles directional at all? and if so, in what
>direction to the wire?

Maximum radiation is perpendicular to the wire with deep nulls at the
wire ends.

>also anyone see anything I can do to improve the performane?, keeping in mind I
>can't go any higher. Would something like an Antron 99 give me any better
>performance?

Your homemade dipole is horizontally polarized. Most CB
antennas are vertical. Using a horizontal antenna to pick up a
vertically polarized wave is possible but the gain is substantially
less. For best results a vertical receiving antenna can more easily
be induced by another vertical transmitting antenna.

Try this. It stays with keeping the cost to a minimum. Use the parts
you already have (coax) Make a coaxial dipole.

Source record: 50306

I have a messenger 1200 amp in my pick up truck. The amp has eight 2879 transistors and also two driving transistors. My radio is a 2950 tuned to put out just under thirty watts peak on sideband. I use the radio and amp almost exclusively on SSB.
The amp has three power settings. So far I have only used low power. At this setting the output of the amp is a little over 600 watts and the SWR reading between the amp and antenna is about 1.3 to 1.

My question is this: How does the low medium and high settings work. Is the switch just changing resistance to the impute of the amp or is some other electronic action occurring. I am satisfied with the amount of output power for SSB but I don't know if my 30 watt impute is too much for the low power setting and related electronics or does that matter.

To put it another way, are there any issues to know about when using any of the power settings. You know, output vs. longevity and clarity.

Please enlighten me. I am sure other people would be interested because none of my friends know either. They are just guessing.

Thanks in advance,
Dennis

Just how did you measure the output impedance of your amp? When you adjust the pi-network your are changing it's output impedance. That is the purpose of the pi-network, it is basically an impedance matching network. It shows you don't understand what you are doing.

Cbnewbie,
If you can erect the dipole away from nearby objects,
like the roof, trees, etc, say between the roof and a tree
with a few feet of fishing line, nylon cord, string, or
whatever to get the ends away from things too, you will
see better results. If it's within a few feet of the roof,
or what ever, it doesn't work very well.
A fipole doesn't really get directional until it's about
a 1/2 wave length above ground. The radiation pattern is
strongest off the sides of the antenna. The pattern is
pretty broad, so I wouldn't expect beam performance.
A horizontal dipole is horizontally polarized (stands
to reason, huh?), and most other stations are going to be
vertically polarized. That will cut down on performance,
how much depends on a number of factors.
An A99, or some other vertically polarized antenna may
perform better than the dipole at 'near' distances. After
the first 'skip', it doesn't make a lot of difference.
Considering it's your first home-made antenna, and where
you've tried it out, that's not bad at all!
Some antenna 'rules' the books don't tell you;
1.Antennas put up in bad weather are always better than those
put up in nice weather.
2.If someone doesn't object to it, it's probably not a very good
antenna.
3.If it works great the first time, you did something wrong.
4.If you follow directions exactly as the instructions say, it
won't work.
5.Big and ugly is always better than small and pretty.
6.(The most important rule) If someone askes about your
antenna... lie a lot.
Good luck and have fun...
'Doc

That's a pretty good description. Where did you find that?

I'm not sure why they consider the voltage and current sums to be
algebraic and not vector but that is not a big deal.

In short, what you measure is the sum of four signals:
forward voltage
+ forward current
+ reverse voltage
+ reverse current
---
resultant meter reading

To be a little more accurate, it should be noted that the meter is
designed for a specific characteristic impedance such that the
signals from the current sensing are equal to the signals from
the voltage sensing.

Thus, you could look at it like this:
forward voltage
+ forward current * Zo
+ reverse voltage
+ reverse current * Zo
---
resultant meter reading

Since (forward current * Zo) = forward voltage, we can perform a
substitution.
Also, note that (reverse current * Zo) = -(reverse voltage).
The reverse voltage and current are 180 degrees out of phase.

Substituting, you get:
forward voltage
+ forward voltage
+ reverse voltage
- reverse voltage
---

resultant meter reading

Simplifying, you get:
resultant meter reading = 2 * (forward voltage)

Thus, the meter has been able to separate out the forward voltage
by summing the combined voltages and currents.

By the way, note that the meter is designed for a specific
characteristic impedance, Zo. It is expecting a particular
relationship between the voltage and current in order to
operate accurately.

True for local contacts via ground wave but for skip signals the signal goes through many rotations and there is no way to tell what polarization it will be when it arrives at the receiving antenna.

The SWR is a function of the match of the feed line and antenna feed point. If the transmission line is 300 ohms and the feed point of the antenna is 300 ohms the SWR on the system will be 1:1. If the output of the transmitter is 50 ohms trying to feed this system it will not have any effect on the SWR on the feed line but it will not get an efficient transfer of power because of the mismatch looking into the feed line.

True, but I have as much interest in skip as I do in the atmospheric
noise. I forgot that for some there may be an
interest in the weather conditions of Boise Idaho.

The switch uses resistors to pad the input, that is all it does, the amp
will last longer in low but the resistors used in the switch have a tendency
to fail from time to time. If you run the amp in high it bypasses the
switches.

Did you take the keying circuit loose? Also how many wraps are on the input transformers? What value caps are across base to base? How many wraps on output transformer? The first thing I would do is take the keying circuit loose and put a jumper across the relay and take the "amp" out of line and check the match.

Base grounded base bias? DC Ground, right?

Hmmmm. according to floyd (Electronic devices, copyright 1986, 87-99),
this would be considered a "class C" circuit and under theoretical conditions
would yield a better than 86% efficiency... in real world terms, at most you can
hope for about 70% (less if you are not using close tolerance parts). Other
intolerances may play here as well (such as hysteresis in the transformers,
variance in values of the capacitors, etc).

The best high efficiency amplifier circuit I have ever had to deal with was a
class C tube setup for ham radio... It required constant retuning when moving
around the bands (incidently, I was not operating the station at the time. that
was left to the ham manning the station).

Just because you bought one doesn't make it good...
Wake up! Nobody in his right mind makes RF equipment by taking a copper clad board and pasting little copper strips on it instead of laying out a real circuit board. That's method may be all right for prototypes... but NOT for production units!!!!!!!

You're the sucker that paid top dollar for nothing more than his experimental prototype...

I am no DaveMade fan but you are wrong professor, not etching the board
gives the amp a better groundplane. An etched board is like an obstacle
coarse for the ground path. Sometimes I believe the theory you swear by is
your own.

what about something called "skin effect"?
at some point, increasing the guage of wire will only have a
detrimental effect on your current handling capability.

This is especially true when dealing with E^2*R losses at
high energy/frequency levels.

I hope you are kidding...
If you aren't... then I feel sorry for you...
It's funny that no other manufactuer of electronic equipment feels it's
necessary to put tape under a relay. Strange, isn't it. I think if you use
your head... the reason he uses the tape is to hold the relay in place!
Unreal...

Let me see you design an amp for microwave using your "etched" board, Read
up professor you will discover that not etching the top of the board is a
real good idea at these higher frequencys.

Nonsense.. a good ground plane on a circuit board can be gotten by the
etching method. You name me one commercial RF amp that uses the "pasty
copper strips" method. Bet you can't...

That method is awful! It introduces all kinds of stray inductances and
capaitances making the unit unstable... that's why it's never used in real
world equipment that's any good!

Who said anything about microwaves... not me. I design amps every day for a living between 20 and 150MHZ. The ground plane is very important and is on the top and the bottom of the board along with all traces. The boards also have many vias that connect the bottom ground plane to the top ground plane. That my friend is good RF layout techniques.

Good points. As a practical matter, getting a 1.5 on the usual dipole would
probably indicate a 30 ohm feedpoint rather than a 75 because I will never
get the turkey high enough to get to 75. But there is no way in this world
to tell with an SWR bridge.

Take for example a transmitter more or less slopped to 50 ohms - if a winding takes 1/3 of a turn to be on the money, it is a fair bet that turn will be missing or completed. No transistor is exactly on spec and protection circuits vary. Now put that on a good base loaded antenna that needs to be tapped up the coil to get to 50 ohms - the base will be closer to 20. Assume I have used some form of GDO or whatever to get it resonant. Yes, minimum VSWR will be at 50 ohms on the tap. But I might get a better match to the transmitter, or even draw a bit more collector current out of it, by sneaking down the coil a tad. I am not going to bust my pretty pink tushie over a difference that might extend my effective range 6-8 feet but it is one more case where VSWR is only one carrot in the stew and not in a league with the onions.

Make sure the coax leaving the PL-259 (or the relay) to the input of the amplifier is not shorted also check the output in the same manner. Also check the input of amplifier for a shorted capacitor. Good luck.

Congratulations! Doc's antenna rules are 100% correct. The trick is as high and far away from everything as you can get it.

Now you bought 70 feet of wire and used about 18 feet of it. Let's use that up.

1. Take another 18 feet and 'fold' the dipole. Use something like PVC or any good insulating material to keep the wires a few inches (1-3 not critical) apart so the whole thing is about 37 feet of wire. If you must run the antenna near a bunch of roofing nails, splitting the current between two wires decreases the near magnetic field by a factor of four and puts out a bit more of your transmit power into useful effort and a little less into heating roofing nails. Don't feed them both, just think of it as a squashed loop.

2. Take what is left and make a real loop out of it, 36-37 ft., and hang it off the high side of your house as a point-down triangle, a square, or a rectangle with the sides no longer than twice the top and bottom.

Play a bit! For the moment, don't sweat VSWR. The input impedance is above 50 ohms and will not cause damage to your rig. Keep good notes!.

Hey guys and girls.. I've been out of the CB craze for a long while now and have some equipment like my CDE 45 antenna rotor i was looking to sell.. I don't remember just how much i paid back in the days but was wondering if may-be someone out there might know what a decent price for one sells for now.. This antenna rotor is in A1 condition with all hardware and instruction manual.. Thanks in advance for any info i receive..

Just out of curiosity I read the page below.
It seems as if the people involved in explaining
wattage on this page need to re-examine some
elementary theory. Here's the most obvious mistake
of many found on this page. I wouldn't normally point it
out but I am doing so because the author goes on to
say there are many misconceptions in regards to wattage.
So here is their misconception.

"Power can be measured in RMS, Peak, or PEP. Just as a distance
seems 'bigger' if measured in feet rather than miles, 5280 feet still
equal 1 mile. The same with power, 70.7 watts RMS, is a still 100
watts Peak. To talk about distance, everyone should use the same
measurement unit (feet/yards/miles) or there can be a very big
misunderstanding about the distance your talking about. The same
holds true for talking about RF power."

Yeah we know.....70.7 watts RMS = 100 watts Peak?????

It is good layout but a solid groundplane is superior. Tell me what can possibly fail with the strip design on the Dave amps?

Also tell me what you do when the copper board under the pill tab tears loose on one of your amps? Don't say it doesn't happen, probably doesn't, you don't have thousands of them out there with people running them at 20 Volts, but if a piece of copper foil did tear loose what would you do? You damn sure couldn't replace a power strip you would have to completely rebuild the amp.
I personally believe it to be a good idea and easy to mass produce with predictability.

What makes commercial amps any better? When are comercial amps ever way over
driven and way over volted? I bet I could drive your little one pill to
unstability, but buy itself its hard to see harmonics, parasitics and a
whole lot of "stray inductance" in a one pill. I give you credit for the
fight you put up but keep in mind, regardless of what you design you are
still posting photos of a 150 watt amp and trying to impress CBer's in doing
it. I could show you things that would blow your mind.

Hey prof I need one of your amps to power a 440 repeater since you are so good at making amps I want it to take 350 miliwatts and put out 100 on 70 cm ham band.
the exciter I am going to use to kick it is a old Ge Mastr II .The 100 watt pa is toast so I need a new one. he he he lol later and 73's de Genocide the 357 Magnum in West By God Virginia.

3839. Re: N9VKS: Indiana ham arrested for having a scanner

Newsgroup: rec.radio.cb
Date: 2000-08-29 00:20:39 UTC
From: Gibstah <gibstahnospam@bellatlantic.net>
Message-ID: <rlDq5.386$cV4.15634@typhoon1.ba-dsg.net>
Source record: 50196
Cross-posted to: rec.radio.amateur.misc,rec.radio.cb,rec.radio.scanner,rec.radio.shortwave

What happens to me<no radio ticket>is I always hit these
vehicle inspection sticker check points in these rinky dink
little towns on the way to Atlantic City a few times a
month.I have seen some postings recently where it says non- hams may have
this equipment<my state only YOUR rinky-dink lil states rules may apply>and
not fear prosecution.You really dont know what to beleive till
the PROCESS happens to you.So I come up on 2 this month.The first time I
just in a 2 second non-furtive
movement,I had the whole apparatus disconnected
and stashed out of view in carry bin behind the 2 passenger seats.The second
time I disconnected
the stock bc-245xlt antenna <makes radio very scanner looking> and slipped
on dual band custom antenna
which makes the 245 look like some kind of
wacky nextel phone of the future and just left it there.
What would you do?If you're not a ham?
spread the love and care around the household,Gibstah

Mike, the 3m tape actually holds very well it is found under the relay and the power strip under normal use and abuse don't see where this is a problem. Perhaps ask some others that own them as well as the xforce amps they should tell you it is not a problem.

>>>Good excuse ! if he had it back 4 times why not fix the fuck up?<<<

as someone else said , it prolly wasn't the amp the was the cause . may have
been over driving it , bad antenna . or any # of operator error's

Keep in mind that there are new people coming to the group everyday anxious
to learn all the old news you can muster.
Also, antenna's like the Dr. Crows, 55's Starguns etc. are not known or
readily available to the new CBer as well as the general CB public.
A little more compassion and humility and less hostility will go along way
in furthering this hobby.

The length of these antenna's are not always practical and the height and weight of the large coiled antennas are not suitable for all users and vehicles. I tried a double coiled steel antenna on the trunk of a 94 Cougar and I thought it was to take the trunk off.
So, unless you have a vehicle that can take the load of the large coiled antenna's or you live in the Big Sky country where low hanging trees, bridges and low flying geese are minimal so you can use the long sticks stick with the Wilson's or 5' sticks.

The Wilson is definately better than ANY top loaded or ANY whip. I have tested all of them and the only thing that beats the Wilson was a 3/4" x 9' copper pipe and some of those big huge aluminum coil antennas, and that wasn't by much. I tested a Wilson 5000 base load.
For the everyday CB'er, you can't beat the W5000 roof or magnet without going to the big aluminum antennas.

3857. Re: One LAST SWR Question

Newsgroup: rec.radio.cb
Date: 2000-08-29 02:33:58 UTC
From: Bill Nelson <billn@spock.peak.org>
Message-ID: <8of7em$pv5$1@bashir.peak.org>
Source record: 50215

'Doc <w5lz@oio.net> wrote:

: Bill Nelson wrote:
:>
:> No, that is not true. It does not matter if the radio or amplifer output
:> impedance is 5 ohms or 5000 ohms - it still will not affect the SWR. All
:> that matters is the impedance of the antenna and the coax connected to the
:> antenna.

: Sure it's true! SWR is the relationship between forward and
: reflected
: voltage. The voltages being compared are a product of RF current (I)
: times
: the impedance (Z) in the circuit. In the antenna ~system~ (feedline
: and
: antenna), the voltages (forward and reflected) are the product of RF
: current
: and ~system~ impedance. You can not find SWR without impedances.

I was not disagreeing with that - read what I wrote. The point is that
the radio or amplifer impedances are immaterial. The SWR is determined
only by the quality of the match between the antenna and the feedline.

: Exactly
: like saying you cant have voltage without resistance.
: If the output impedance of an amplifier is NOT the same as the
: impedance
: of the antenna ~system~(feedline and antenna), the SWR will NOT be
: 1.0:1.

Uh, I think you need to read a text on elementary transmission line
theory.

: Same with the output impedance of the radio. Impedance determines
: voltage,
: and that's what your measuring when you measure SWR.

See above.

Yes, exactly. They actually used to do this (maybe they still do) at
microwave frequencies in waveguides. They have a probe that slides
up and down the waveguide to locate and measure the peaks and nulls
to determine the SWR. With this setup, the standing waves were very
visible; you could see them by sliding the probe up and down the
waveguide.

3861. Re: One LAST SWR Question

Source record: 50219

'Doc <w5lz@oio.net> wrote:

: How does a transmitters output impedance change SWR? Please pay
: attention, it's not often I 'pound sand'. If you measure the SWR
: of an antenna system the meter is commonly placed at the output of
: the transmitter, not at the feed line antenna junction. The SWR
: is a ratio of forward voltage and reflected voltage as measured
: at the transmitter.

Make that "improperly measured". For example, feed power from a transmitter into a few thousand feet of lossy line, and connect an antenna with a 3:1 mismatch on the end. If you measure the SWR at the transmitter, it is going to read close to a perfect match.

In other words, measuring the SWR at the transmitter can only provide a "relative SWR reading".

: If the transmitter output impedance is 50 ohms
: (common), and the antenna system's impedance is 50 ohms, the SWR
: will be 1.0:1 (no reflected voltage). The output impedance of the
: transmitter and the input impedance of the antenna system are the
: same. If the antenna system's input impedance is 75 ohms or about
: 33 ohms, and the transmitter output impedance is 50 ohms, then the
: SWR is 1.5:1. Now, it just so happens that the ratio of transmitter
: impedance and antenna system impedance follows this exact same
: ratio. It isn't too hard to prove, it's almost as simple as Ohm's
: is, and how they relate in an A/C circuit. If you substitute "Z"
: for "R", then; I x Z = V. Since that "V" is what your measuring
: when you determine SWR, I think you should be able to see that there
: is a relationship between the "Z's" of the transmitter and antenna
: system.

This is only true if the transmitter impedance matches that of the transmission line. There is no guarantee this is true, and frequently is not, either through design or necessity.

Now, what happens if (for example) the transmitter impedance is 50 ohms, the transmission line impedance is 300 ohms and the antenna impedance is 50 ohms?

By your claim, the SWR is 1:1. Hook up an SWR meter, and you will find that you are wrong. It will be 6:1.

: Which book should you read? I'd recommend one that deals with
: alternating currents. The library is full of them. Pick one who's
: 'style' is easiest for you to understand. You might also review
: algebra and trigonometry.

The Radio Amateur's Handbook would be a good place for you to start.
The transmission line theory there is a simplified version of what
electrical engineering students usually study as one class during their
second year of college.

That explanation is anything but clear. Why don't you just cite us
any book or article that supports your claim that SWR is dependent
on transmitter impedance.

I don't want just any book. I want the one that shows the formula
for SWR which includes transmitter impedance as one of the variables.
I've got plenty of books and I'm sure that none of them have this.
Help me out.

OK, I load up my 32V-3 transmitter for max output. The tank circuit of this transmitter is adjustable to match a range of impedance's. So when loaded for max power transfer, the output of the transmitter is matched to the feed line, which is matched to the antenna system. The SWR is about 1.2:1. Now I adjust the output of the transmitter so that I am only getting about half the power transfer which means that I have changed it's output impedance. Guess what, the SWR still measures 1:2 to 1. The output impedance of the source does not have any effect on the SWR of the feed line/antenna system. I would very much like you to point me to a technical publication that states the source impedance will have an effect on the SWR of the feedline/antenna system. SWR is the relationship of the forward power (going to the load) to the reflected power (coming from the load), it has nothing to do with the source. SWR is a measure of the mismatch between the load and the line, not the source and line.

I hate to nit-pick here but, just for the sake of accuracy:
Voltage standing waves are created by the sum of the forward
voltage and reflected voltage. If you somehow only knew the forward
voltage and reflected voltage, you could still calculate the SWR
without ever knowing what the power or characteristic impedance are.

Since the forward (and reflected) current is directly related
to the forward (and reflected) voltage by the transmission line
characteristic impedance, it is fair to say that SWR is a relationship
between forward and reflected voltage. Forward (and reflected power is
directly proportional to forward (and reflected) voltage squared.

> ...Any SWR meter that you do not have to move in the line from node
> to anti-node calculates SWR by measuring POWER.

Yeah, but these meters are built for a specific characteristic impedance
(typically 50 ohms). Thus, the characteristic impedance is generally
known. If you know the characteristic impedance, you only need to
know the voltage to also know the power or vice versa.

> POWER is both CURRENT and VOLTAGE. Power is what directional
> couplers measure, not voltage or current alone.

I agree that directional couplers sense both voltage and current.
I'm just saying that, since we are operating at a characteristic
impedance, knowing the forward voltage is equivalent to knowing the
forward power since they are directly calculable from each other.

The reason that a direction coupler must measure both voltage and
current is that a CB transmits in a steady state mode where it
is impossible for a voltage measuring device to separate the
forward voltage from the reflected voltage. The current must be
known in order to do this.

Hey Doc, per The ARRL antenna book, The voltage at the forward port is a fuction of the VECTOR SUM of the forward current and voltage and the voltage at the reflected port a function of the vector difference of the voltage and current. It is easy to see how this mistake can be made though as there are several text that only talk about the VOLTAGE at the ports. Jim Carr and Willam Orr are both guilty of this over simplification. This is because the final output of the sensor is a voltage read by a voltmeter. They do not bother to explain that this voltage is derived from both current and voltage from the transmission line. The ARRL explanation is also in agreement with the FAA's text book on transmission line theory and MIT's radar handbook..Hey, Guess I CAN say this with a straight face without being a poltitian.

George,
A common SWR meter measures forward and reflected voltage between
a source and a load, to arrive at an SWR figure/value. These voltages
are the product of the current and impedances (since it's an A/C
circuit) of the source and load. You can only have voltage by moving
a current through a resistance or impedance. There is a direct
relationship between impedance and voltage in a feed line. SWR is a
ratio of forward and reflected voltage, the ratio of source and load
impedances have the same relationship. I can't think of any way to
say it that's more simple than that. You probably won't find this

stated
in exactly the same way in any book, it does require some thinking.
Try the "handbook", it'll give you the theory, the thinking part is
up to you.

I agree with you George so ignore anything not directed to what you said. The

rest is for Doc.

Yes IF you knew only the forward and reflected voltage componet and the impedance of the line you COULD calculate the SWR but this is NOT how they work. The output ports of an SWR meter by there design provide a voltage that is a fuction of the VECTOR SUM of voltage and current for forward and the VECTOR DIFFERENCE for reflected. This is per the ARRL antenna book, the FAA transmission line text book and MIT's radar handbook. There are a few books around that do not explain the relationship between current and voltage and give the impression that it is only voltage that is being considered. William Orr and Bill Carr do this.. They only mention the resulting voltages from the sensor and not the componets of the signal they represent and This is compounded by the fact they they use the term voltmeter as the measuring device. They are not wrong in their explantions, they just leave out a lot. I guess I can say this without being a politican.

I suspect that the equipment need for extracing just the voltage componet would be much more complicated than a typical SWR meter. Of course if you know the impedance, forward and reflected power you could calculate forward or reflected voltage for whatever good it would do you.

The RAH you read you must have written yourself, all the one's I have do not mention the source impedance as having anything to do with SWR. When the SWR is 1:1 the source sees whatever the characteristic impedance (Zo) the line is and the line appears to be infinitely long. When there are standing waves on the line, the input impedance to the line may have a wide range of values so the source may no longer see the Zo of the line. It depends upon the line length. If the line length is such that there is a high voltage/low current node at the input, then the source sees a higher than the Zo of the line. If the line length is such that there is a low voltage/high current node at the input, the source sees a lower than the Zo. That is why a pi-type output tank circuit, the output of the transmitter can be adjusted to match whatever the input impedance of the line is (within a range), but whatever the SWR is on the line it remains the same regardless of whatever impedance the output of the source is changed to. Changing the output impedance of the transmitter to match whatever input impedance it is looking into does not make the SWR on the line 1:1 or change it to any other value.

Correct, a ratio of forward (to the load) to reflected (from the load), the
source impedance has nothing to do with it.

> the ratio of source and load
> impedances have the same relationship.

Nonsense.

Give a formula that calculates SWR where the source impedance is figured in.
If you have a line with a Zo of 50 ohms and a Zr of 25 ohms, what is the SWR?
Now with the same Zo and Zr, if the source impedance is known to be 75 ohms,
what is the SWR? The formula I have is SWR = Zo/Zr. Nowhere in the formula is
the source impedance mentioned.
Zo = characteristic impedance of the line
Zr = impedance of the load

If the problem was simply welded contacts, you would not hear the relay pull in when you turn the amp on. With power off check from the center of the RCA antenna relay jack to chassis and see if you get a low resistance reading.

You are talking nonsense. Any change to the PI output network of an amplifier will change the amplifier output impedance.

I think you're just trolling for arguments now by purposely posting misinformation.

Hmm good Idea, I will try that. But when the amp is off and the signal goes throught the relay the SWR is fine, but when turned on it goes through the amp and it goes high. Thats what leads me to believe the PL259 are ok.

I like the strip idea personally , but cant argue the merit of it
effectiveness. What I can say with a certain amount of conviction and agree
with Boo, is that the more ground plain the better.

It's not a good idea to gear down on ssb it put alot of strain on the
resistors from the radio's higher ssb output.

I use an existing circuit board that was designed for use as an RF
amplifier.
I buy it from Communication Concepts. It's PCB #EB63

Check your SWR with the built in meter on your radio, do this with your amp
on, the jumper that gives you the best SWR at the radio is the one to use.

What you are seeing is normal. Since the match at the input of the DaveMade is probably far from perfect... you will see this impedance shifting at different points on the coax. What would I do about it? Nothing... this will happen with any set-up. Make sure your SWR is as low as possible with the amp off. That's all you need to do. Any lengthening or shortening of the coax can be done purely for the purpose of keeping the meters needle from banging the right end... it will not change your match.

The vehicle's frame is what you are using for your ground plane. It's not necessary or beneficial to attach grounds to things such as the tailpipe or transmission. They will have no effect on how well you will be getting out...

Cowboy,
How about this for a simple 1/4 wave ground plane base
antenna.
You will need about 26' feet of wire, one insulator, a
fairly tall tree, some coax for a feed line, and enough
small rope to throw over a high limb in the tree.
Cut one piece of wire 8'8" long. Attach the wire to the
insulator so that there is 8'7" of wire hanging free. Make
a small loop in the wire at the end away from the insulator.
Feed the remaining wire half way through the opposite end
of the insulator, then give the insulator a couple of twists
to secure the wire so it can not slip through the insulator.
Make a small loop in each end of this wire.
Looks sorta like this;
o <--loop{A}
|
| <---8'7" wire
|
|
[-] <--insulator
loop--> o-----------o-----------o <--loop in one end of 17'3"
^-(twist) piece of wire.

Solder the center conductor of the piece of coax to the 8'7"
wire attached at the 'top' of the insulator. Solder the braid
of the coax to the 'twist' of wire at the bottom of the insulator.
Throw the rope over a high limb on the tree, and attach to the
loop {A}. Also, tie some rope to the loops on each end of the
longer piece of wire. Pull the antenna up to within a foot or
two of the limb the rope goes over. Use the other pieces of rope
to spread the 'bottom' wires so that they are about horizontal,
or at least greater than 45* from the vertical. Now you have a
groundplane antenna hanging in the tree.
To tune the antenna, check SWR at ch-40 and ch-1. If the ch-1
SWR is higher than the ch-40 SWR, the vertical wire is too short,
add an inch or two, check the SWR again. Repeat until you get
the lowest SWR, which may not be too low.
When you have the lowest SWR possible, adjust the 'angle of
the dangle' of the two bottom wires (between horizontal and about
a 45* angle), till you get an acceptible SWR. Plug in the coax,
and use the antenna.
The height, length of the vertical element, and the angle between
the two bottom wires(radials) can all be varied to tune the antenna.
There you have a home-made base antenna that cost you maybe $3.00,

or less if you have any of the parts laying around. There's no particular kind of wire needed, anything will work. The insulator also isn't anything special, as long as it ~is~ an insulator. It takes longer to read this than it does to make the thing...

George,
The reference to the 1969 ARRL Handbook about a basic bridge circuit. No reference to current, no current sampling. I'm not going to duplicate the article here.

The reference to the 1999 ARRL Handbook about an SWR detector audio adapter. The second paragraph states that a meter displays SWR by measuring the feed line forward and reflected voltages.

The two referecnes do prove what I said.

Set the calibration as instructed (to the cal. mark). Turning
it all the way up does not increase sensitivity.

Reminds me of the guy that would adjust his SWR by turning his calibration knob so his SWR would read 1:1. Goes with turning all knobs to the right... <g>

the two places that had picks change thier sights .
exportradios had i pick , but there antenna section is being rebuilt

and president-elertronics.com had one but they changed . they have about 60 antenna's and post about 10 of them at a time changing them once in a while .

and my computer is a dinosaur , i cannot post pics , just text . so i dunno what to tell ya , hit those search engine for those online radio stores , someone has to have them

they are not a popular antenna , the price range is about the same as a nug-a-tron (ugly-tron as i call them) . but its the best antenna i can find .a buddy of mine switched from one of the nug-a-tron / 55 lookalike antenna , and says the pres. penn . out preforms it .

I did not ask for you to duplicate the article here, I asked for the title of the chapter you are referring to so I can find the same information in my handbook. Is that so hard? There are several places in the handbook that talk about basic bridge circuits, so just which chapter is it?

>
>
> The reference to the 1999 ARRL Handbook about an SWR

Ok, so the meter displays SWR by measuring the FEED LINE forward and reflected voltages, so how does the impedance of the source have any effect?

>
>
> The two referecnes do prove what I said.

Since you hedge on being specific so we can verify what you are referring to, it only proves you don't know what you said.

Good point. At the higher extreme, the SWR tends to 2-2.5. Won't hurt the radio, but you are bleeding power. I haven't ever transmitted on those bands, however, seems to receive good. I usually hear a lot of foreign chatter from South America.

The 1969 and 1999 reference is to a construction project. It would have been pointless to go into a full explanation of how SWR bridges work. They would have had to devote at least a good paragraph to explain it in the most simple form. I doubt if they wanted to do this with every SWR bridge project they printed. Using this as a reference is like going to an amp project expecting them to go in-depth on how the tube works. In the 15th edition of the antenna book on page 27-8 they give a better although still abbreviated explanation. This is near the end of the paragraph headed "Design Philosophy" It states,"The voltages rectified by D1 and D2 represent, in one case, the vector sum of the voltages caused by the LINE CURRENT and VOLTAGE, and in the other, the vector difference". The two cases they are refering to is forward and reflected.

I found my reference by finding an article that said pretty much what Doc's reference said but it also said that if you wanted more info on how it worked refer to the antenna book. This is the case a lot of the times with the handbook. It supplies just general information and if you need anything more in-depth you will have to go to one of the more specific publications.

This bridge circuit is not what is found in a typical SWR meter.

> The reference to the 1999 ARRL Handbook about an SWR
> detector audio adapter. The second paragraph states
> that a meter displays SWR by measuring the feed line

Yes, but *how* does it measure the forward voltage? It can
only do this by measuring both voltage and current. Yesterday,
I posted some simple algebra to show how it is done in a
typical SWR meter.

> The two referecnes do prove what I said.

By the way, I'd say George made a pretty good case that the ARRL proves what he is saying. Are you saying that the ARRL handbook contradicts itself? If so, then you can hardly use it as support for your claim. George's claims are supported by the ARRL handbook without any contradictions.

The two cases they are refering to is forward and reflected.

I found my reference by finding an article that said pretty much what Doc's reference said but it also said that if you wanted more info on how it worked refer to the antenna book. This is the case a lot of the times with the handbook. It supplies just general information and if you need anything more in-depth you will have to go to one of the more specific publications.

> The reference to the 1969 ARRL Handbook about a basic
> bridge circuit. No reference to current, no current
> sampling. I'm not going to duplicate the article here.

This bridge circuit is not what is found in a typical SWR meter.
We *were* talking about typical SWR meters.

> The reference to the 1999 ARRL Handbook about an SWR
> detector audio adapter. The second paragraph states
> that a meter displays SWR by measuring the feed line
> forward and reflected voltages.

Yes, but *how* does it measure the forward voltage? It can
only do this by measuring both voltage and current. Yesterday,
I posted some simple algebra to show how it is done in a
typical SWR meter. Why don't you make an attempt to describe
what is wrong with it? After all, you told me I needed to
"review algebra and trigonometry." Here it is:

In article <39AAB0C2.C2A6FD9D@oio.net>, 'Doc <w5lz@oio.net> wrote:

> Which book should you read? I'd recommend one that deals with
> alternating currents. The library is full of them. Pick one who's
> 'style' is easiest for you to understand. You might also review
> algebra and trigonometry.
> 'Doc

So, now I've laid a little algebra on you and I don't see any
response from you to it. Tell me what's wrong. I've been able to
show descriptively and mathematically how a typical SWR meter senses
both voltage and current to detect forward and reflected voltages.
George's excerpts from the ARRL Handbook (see below) fully support
what I am saying.

> The two referecnes do prove what I said.
> 'Doc

No, they don't. You are misinterpreting what you read

By the way, I'd say George made a pretty good case that the ARRL
proves what he is saying. Right here it is.

George Warner <warnergt@ptd.net> wrote:

> Then, they show a circuit for a "reflected power meter." This is it;

> sampling.
> It goes on to say, "The relative phase of the voltage across R1 is
> determined by the phase of the current in the line." Note: current
> sampling.
>
> Now, tell us how you can conclude that it samples voltage only.

So Doc, are you saying that the ARRL handbook contradicts itself? If
so, then you can hardly use it as support for your claims.
George's claims are supported by the ARRL handbook without any
contradictions.

I guess I'm the only one making these claims because I'm
correct in what I'm saying.
One clarification... did you notice the "antenna system",
instead of feed line and antenna? Does that make any
difference
in what you think I said?
Do I do transmission line design for a living? Nope, I sure
didn't. But transmission line theory isn't ~that~ hard to
understand. There are a bunch of us who do.

How is it "stray"? The strips are single sided copper and they are very small pieces where in almost every place they are used there is already a capacitor to ground. You are going by YOUR theory again, break it down for the group of exactly how this "stray" capacitance causes instability. Dave has some of the most stable driver stage type amps out there. All of them use the strips with a solid ground plane underneath. Let me see your example of 2 driving 6 on an antenna with a crummy match not go into oscillation, I don't think you have a clue.

I use a dipole here and it works great (also homemade). Mine is horizontally polarized too, but it is straight across, not at any angle. It's mounted on the backside of a wooden deck, only about 8 feet off of the ground. The length of each leg ended up being about 94".. I started with 105" and trimmed until I got a good SWR.. I've contacted as far as Australia with it, from Rhode Island. I do admit that for local talking it's not that great because everyone else is using verticals, but I do mostly SSB work anyway.

Not bad. Come back sometime when you've had the chance to work a
little DX running a million watts erp. (sure, no one believes it).
Just wait until you've loaded a 40,000 watt OUTPUT military HF
transmitter into a RHOMBIC antenna 600 feet on a leg and 200 feet in
the air. That is when the KW stations were running S2 on Guam and we
put the fire to the wire - and pounded into the states at 40 over 9!
Been there, done that.
Jim

I am just driving it with a radio doing 30 watts, I thought the lower the input watts the lower the SWR. The higher the watts the higher the SWR.

Not on a grounded base amplifier.

Since the transistors are only "on" a short period of the drive cycle, you will only see a load for this short period.

This means, your amplifier needs to be saturated on the input.... Which translates to more drive.

This is actually a common problem among amps that use the correct ferrite in them for the frequency in question.

Is this the Messenger? If so, and you still have it when I get their, we can look at it.

You state you dead key it at 30, and the amp swings 2300.

WTF was that all about.

What are you feeding the amp, on a modulation crest (read that a AAAUUUDDDDio or single tone).

What are you seeing out of the amp AT THAT TIME?

That is what he wants to know.

And Dennis and the rest will tell you that you need a new wattmeter claiming 2300 watts out of a 4 pill. Good lord.. Thats 600 watts per 2879!

Toll Free

Hi,

It is in Sams #54 under "T" (23 Channel).

I have the Sams, and the Schematic is 5 pages. I can probably get it scanned . I may be able to identify the resistor if you can tell me where it connects on both ends. I am gussing it is R79, which is a 1K 2Watt film resistor and connects between Pin7 of Output / Modulator V6 (6BQ5) and thru D7 (a 1N4004 diode) and L4 (13ohm resistor with parasitic winding) to pin 7 of the final V10 (6BQ5).

Otherwise it could be either a 33 ohm or 22k Ohm that go to pin 2 on V10 the 6BQ5 Final.

Will try to help if I can

David

#22--
I agree about (the Pennsylvania) being broadbanded, and as you say different... but, the other tech that works at the shop has one...., and he was on cloud 9 about this thing.., and challenged me (barefoot to barefoot/ his 2510, versus my 2950), he has the Pennsylvania on an 85 Camaro (custom-mounted on a 22" wilson shaft, out of his trailer hitch, using a one-piece stinger ..made from a Hustler Stainless steel 102" whip....it has a 2.5mhz bandwidth----250 channels.) I have a Stargun 20-2 Lightning Rod, a continuously-loaded, 9 foot 'fighting stick'...Needless to say, the Pennsylvania couldn't touch it!!(niether could the 102"whip).......Just my 2 cents......

3998. Ford fuel-pump filter, easy install?

Newsgroup: rec.radio.cb
Date: 2000-08-30 00:00:00 UTC
From: Matt Melvin <mmelvin@istar.ca>
Message-ID: <iyir5.5670$b05.75846@cac1.rdr.news.psi.ca>
Source record: 50519

Hi,

Just curious to know what's involved in installing the infamous Ford Fuzz Filter. My car just passed out of warranty about the time I read the posts on this, so I'm wondering if it's something I can do on a Saturday afternoon, or is it off to the dealer? I have a '98 Contour. I'm fine to do an oil change, spark plugs & ignition wires, that kind of thing, but more than that and I'm not the guy.

Clearer reception is great, but not if I accidentally fry my car's electrics and blow myself up.

Thanks for any input from those who've done it.

Matt

Matt,
The fuel pump is in the fuel tank, The 'best' place to
put the filter is as near the pump as possible. How do you
feel about dropping the fuel tank??

If you making a folded dipole, you'll need a 6:1 balun to feed
it with 50 coax. You changed the input impedance to 300 ohms
when
you made the folded dipole. - 'Doc

Probably won't damage the radio, but it will affect the amount of
radiated power. A 2:1 or even 3:1 SWR isn't 'real' bad, but a 6:1
or
higher is getting a bit much. - 'Doc

Doc, he is running this beast 15 inches off a roof. The feedpoint impedance now is at best 30 ohms. Quadrupling it to 100-120 is no big deal compared to where he is now. We can talk about Q sections later. In the meantime, a whole lot more is to be gained cutting down the heating of roofing nails than sweating SWR.

According to my experience and 20.2 in my handbook a dipole doesn't get to the 73 ohm range until it is a quarter wave above rf ground and reaches as hi as 95 or so between quarter waves. Even at .2 it is 50 ohms.

Take a good look at his VSWR readings and tell me again he is not warming the roof.

Dick

Tim,

I believe that your local U.S. Post Office Branch
will be able to accommodate you nicely. I have shipped
to S.A. on several occasions....You have two options:

Air Mail or Surface....For example, a 10 lb. package
from arizona to brazil runs $48.00/AirMail and $25.00
for surface delivery. Contact your local postmaster for
the details. I can assure you that common carriers such
as UPS, RPS and FedX are not the way to go, if you're
wanting to accomplish this as inexpensively as possible.

Don't forget to purchase the insurance too.

73,
NAO911/Jack

The Wilson webb site probably has this information.

http://www.wilsonantenna.com

BTW, writing in all caps is hard to read and also is considered shouting.

exportradios.com has them for sale , i would try to find a local radio shop that deals with the president radios , made by the same people .

i baught one about a month ago , upgraded from a wilson5000

its the best damn antenna i have ever had , my swrs don't go above 1.5 till i am well into the 10 and 12 meter bands . and it can take 2000 watts .

looks compleatly different than any other antenna , has a 2 section whip , about 2 feet (about) of 3/8 . then about 5 feet of the normal 1/4 whip .

and no cutting is needed to match the swrs , tunes by a coil on back . i have turned about 6 people onto these antenna's and they all loved them .

Maybe technically grounding the base can be called class C (it is more class B than C), but to get the high efficiency quoted in your post the base must be biased much further beyond cutoff. If you saw a class C amp being run on the ham bands it was for AM with high level modulation, CW, or FM, and the operating class was not the reason it had to be retuned when moving around the bands. Unless the amp is designed for broadbanded output, it is going to have to be retuned if you change frequencies more than a few KHz, and certainly from band to band.

I have to agree with the last part of this statement. I truly was looking to buy a different antenna and went to the AntennaWareHouse website just last night in fact. Tim, this is not a BS thing here at all in fact I think it is a legit question. Do you treat your customers the same way you do people here in the newsgroup? Customer Service is number 1 in my book, even over being the cheapest!!!!!! I know that my little sale from you will not break or make you however I would like to think that if I needed a question answered I would not be treated in this manner at all!!!!

I do have some questions for you but am waiting to see what sort of reply this will bring. I can understand if someone tweaked you but if this is really how your company is will then.....

Peace!!

You are still wrong PeeWee, Do you whach wrestling? because its just like the Rock say" It just doesnt matter" if the pill are in the box or not the tape does not hold down the transformers, understand that it holds down the power strip and secures the relay, the power strip is where your power wires come into the amp only at this point pills can be in or out of the amp and nothing that has tape on it is touched. when you take the pills out the 10 ohm base resistor holds the input transformer down, and the 120pf caps hold the output transfomer side no tape at all....

It looks like I don't have the same year of ARRL handbooks as you but
I'm looking at the 1989 edition and I'm guessing that the description
that I have is the same as what you are looking at.

They show a circuit for a "reflectometer" which is not how a
conventional SWR meter works. However, this *is* how some impedance
analyzers work -- like the MFJ products.

Then, they show a circuit for a "reflected power meter." This is it;
this is basically how a typical SWR meter works -- including a Bird
meter. The circuit shown uses a capacitor to sample the voltage and a
transformer to sample the current. The text says, "C1 and C2 form a
voltage divider in which the voltage across C2 is the same phase as
the voltage at that point on the transmission line." Note: voltage
sampling.
It goes on to say, "The relative phase of the voltage across R1 is
determined by the phase of the current in the line." Note: current

sampling.

Now, tell us how you can conclude that it samples voltage only.
You are unequivocally contradicted by the book you are referring to.

sideband <sideband@cac.net> wrote:

: Um... I ::could:: be wrong, but if a radio is set up to transmit over
: a 50 ohm impedance, and the impedance of the antenna system (coax and
: radiator) is of a different impedance (say, 300 ohms), the SWR will be
: poor. Conversely, if a radio is set up to transmit over a 300 ohm
: impedance, and the antenna system is set up for 50 ohms, wouldn't the
: SWR likewise be poor?

In the first case, the SWR will be 1:1 - although the coupling of power into the coax will be poor.

In the second case, if the coax is 50 ohms, then once again the SWR will be 1:1 and the coupling of power into the coax will be poor.

Regardless of what Doc says - if he would just carefully read the relevant section of the Radio Amateur's Handbook - he would see that the source impedance is immaterial. All that matters, in regards to SWR, is the ratio of the impedances between the coax and the antenna.

'Doc <w5lz@oio.net> wrote:

: Bill Nelson wrote:
:>
:> Make that "improperly measured". For example, feed power from a transmitter
:> into a few thousand feet of lossy line, and connect an antenna with a 3:1
:> mismatch on the end. If you measure the SWR at the transmitter, it is going
:> to read close to a perfect match.
:>
: I wouldn't bet on that, (and who's talking about feeding an
: antenna
: through a few thousand feet of lossy coax to start with?). If you
: use a reasonable length of feed line, then have a 3:1 mismatch at
: the antenna, the SWR will be no where near perfect.

No one in their right mind would use a long length of lossy coax. But that
is not the point - it was simply to illustrate that measuring the SWR at
the transmitter does not necessarily provide valid results.

Of course there is a 3:1 mismatch at the antenna - I stated that above.

:> In other words, measuring the SWR at the transmitter can only provide a
:> "relative SWR reading".
:>
: That's original, a "relative SWR" reading! There's no such
: thing.
: What'a concept!

Not at all. Since our meters are imperfect, they are actually providing
a relative reading, every time you use them. That reading of 3:1 may
actually be 4:1 or 2:1.

That does not matter. If you insist on tuning an antenna for minimum
SWR, which is generally NOT the proper way - but is a good starting
point - then you tune for the lowest indicated SWR. It is immaterial
what the actual SWR may be.

I can give you an example of a case where the lowest SWR was not the best.
I once had to design a system where the antenna had to be highly directional
but rather small. In this case, the line losses were of low importance.

If I recall correctly, the SWR due to the impedance mismatch between the line
and the antenna was somewhere in excess of 10:1. I had to install a matching
network at the output of the transmitter to get it to load the designed power
into the transmission line. The antenna was tuned for maximum radiated power,
which was not anywhere close to the lowest SWR reading.

:> This is only true if the transmitter impedance matches that of the
:> transmission line. There is no guarantee this is true, and frequently
:> is not, either through design or necessity.

: No, it's true under any circumstances.

Go back to the Amateur Radio Amateur's Handbook, and reread the material.
Pay careful attention this time.

:> Now, what happens if (for example) the transmitter impedance is 50
:> ohms, the transmission line impedance is 300 ohms and the antenna
:> impedance is 50 ohms?
:>
: Then, there is a mismatch. Resulting antenna system impedance
: would probably be around 120-130 ohms.

Wrong. The impedance of the coax does not change the impedance of the
antenna.

:> By your claim, the SWR is 1:1. Hook up an SWR meter, and you will
:> find that you are wrong. It will be 6:1.

: Actually probably nearer to 3.0:1, but in either case, it wouldn't
: be what I'd call acceptable.

See my example above about "acceptable". But it would be the 6:1 that
I stated above.

:> : Which book should you read? I'd recommend one that deals with
:> : alternating currents. The library is full of them. Pick one who's
:> : 'style' is easiest for you to understand. You might also review
:> : algebra and trigonometry.
:>
:> The Radio Amateur's Handbook would be a good place for you to start.
:> The transmission line theory there is a simplified version of what
:> electrical engineering students usually study as one class during their
:> second year of college.
:>
: I've read the 'RAH' several times, in quite a few different
: editions,
: along with a few others. I even understand what I read! Now it's
: your
: turn... good luck.

Heh, heh! Good one, Doc. Why is it that you are the only one here that
is making the claims you are? Do you do transmission line design for a
living or have you just misread the Handbook?

JR <jr@some.net> wrote:
: The RAH you read you must have written yourself, all the one's I have do not
: mention the source impedance as having anything to do with SWR. When the SWR is
: 1:1 the source sees whatever the characteristic impedance (Zo) the line is and the
: line appears to be infinitely long. When there are standing waves on the line, the
: input impedance to the line may have a wide range of values so the source may no
: longer see the Zo of the line. It depends upon the line length. If the line length
: is such that there is a high voltage/low current node at the input, then the
: source sees a higher than the Zo of the line. If the line length is such that
: there is a low voltage/high current node at the input, the source sees a lower
: than the Zo. That is why a pi-type output tank circuit, the output of the
: transmitter can be adjusted to match whatever the input impedance of the line is
: (within a range), but whatever the SWR is on the line it remains the same
: regardless of whatever impedance the output of the source is changed to. Changing

Good, with one minor clarification. The "input impedance" of the line is not
necessarily the same as the characteristic impedance of the line.

I am positive that you understand this, but it might confuse others.

Eric Oyen <n7zzt@home.com> wrote:
: what about something called "skin effect"?
: at some point, increasing the guage of wire will only have a
: detrimental effect on your current handling capability.

Larger wire will never have a detrimental affect on the current handling capability. Skin effect is a "depth into the conductor" problem, not a conductor diameter problem.

The only real problem with overly large conductors (other than the additional manipulation difficulties) is that you are wasting money on metal that is not needed.

That is why, at UHF frequencies, we often use coax where the center conductor is hollow - rather than being solid in the center.

: This is especially true when dealing with E^2*R losses at
: high energy/frequency levels.

Wrong - see above.

And that would be I^2*R losses.

In any case, the effect does not apply to DC or very low frequency signals.

4035. Need expert opinion on this radio problem

Newsgroup: rec.radio.cb
Date: 2000-08-30 06:43:46 UTC
From: Waterbug <waterbug@hawaii.rr.com>
Message-ID: <C22r5.16972$d4.67689@typhoon.hawaii.rr.com>
Source record: 50393

This puzzles me:
I am running a cobra 148 with a three foot rg214 to my five pill dave box (input) and 12ft coax rg214 (output to antenna). When I "audio" into the mike, the cobra148 needle swings lazy to the red zone (it dead keys on the 7db mark and swings to the triangle (by CAL). BUT....BUT...get this....when I change the three foot jumper (from radio to box) to a TWELVE feet rg214, the needle swings freely- it hits the wall-sort of like if you did not even have any coax connected to the radio. Why is this? Is it because 12ft of rg214 equals a 1/4 wavelength and the radio is seeing a perfect match? I am stumped. Need help.

my tailpipe is almost 9feet long. Should i ground it to the frame or just leave it alone? will it make a difference? And is there such a thing as a grounding point on the vehicle being stronger than another? I have been told that by using instruments that costs "thousands of dollars" it can find the strongest grounding point on the vehicle. Is this true..?

Anybody out here have any eperience with the New 2950dx radios that express electronics sells.Any problems or quirks with them?
How well do they perform on AM with a low deadkey(2-3watts) driving an amp.Do they retain decent modulation on such a low dead key?
Any comments welcome.
Thanks
Alan

Message-ID: <8ol4b8$60ha$1@newssvr05-en0.news.prodigy.com>
Source record: 50551

Well at the rate I am going I will still have it on the bench. Let me put it all back together and dump some more drive into it and see what the SWR looks like. Its not a messenger, its two Texas Star 8 pills put together side by side. It doesn't even resemble a Texas Star any more so don't even begin to go in that direction. I am heading out to the Richmond break over Labor Day, so I wont continue this thread regarding this basket case till after the Holiday.

Have a great week end,
KRS

To answer the original post....the Connex is better becuase of extra feature(s)
and dual finals...
to the second trailer, I would choose Icom

Very simple... the strips are separated from the main ground by tape pieces with some thickness. How do you think a capacitor is made! Exactly like that with two plates separated by a distance. Since the size of the plates (copper strips) and the distances (thickness of the tape) vary from unit to unit... the capacitance they generate can vary all over the map and are unknowns. By building many amps with the same components... you will get variances in performance and unpredictable "stray capacitances" that can cause many instability problems reusulting in poor reliability. This is the reason that method is not done in practice... the problem of stability repeatability.

No, they don't have such a board. In good RF designs... the use of push-pull modules are employed. They are then combined in such a way to give the designer the desired output power.

As far as the FET amplifiers I design... I also design the PCB at work with PCAD200 software. The power levels involved only require one module and run at 28V. They use TMOS type power FETs (usually MRF173s) and are designed for 0.5dB flattness across a wide band (20-100MHZ). They are class A for maximum linearity.

Don't know that Alpha makes any solid-state type amps (not tube) and that's what I'm talking about... but the Henry "SS Series" appears to be a good unit by what I can assess by the photos I've seen. He is definately using the module type design with is an approved method. His units are also higher priced. I guess you get what you pay for...

OK, Doc. I found the book. This is from the 2000 ARRL Handbook CD
(I forgot I had this).

This is from the "Transmission Lines" section, page 19.15 and
I quote:
"Whatever the application, the conditions existing at the load, and
only the load, determine the reflection coefficient, and hence the
standing-wave ratio, on the line."

That 'style' is easy for me to understand. How about you?

All I ask you for was the title of the chapter you referred to in the 69 handbook so I could find the same information in my 67 handbook. You can't or won't even do that. I guess you're afraid there is really nothing there to uphold your claim about SWR and the source impedance.

Anything above 40 and below 1 is illegal to transmit on and those channels offer some incredible DX. Ignore the folks who tell you what to do and what channels to talk on, although it is a poor choice to enter the 10 meter band at 28 megs and above. Some stiff penalties are always a possibility should you be popped for illegal transmissions. Learn the law and the ramifications for infractions and decide for yourself what to do.

: detector audio adapter. The second paragraph states
: that a meter displays SWR by measuring the feed line
: forward and reflected voltages.

Which is true. So what? It says absolutely nothing about source
impedances. Read about where the reflected wave comes from that
is measured. Then think about what happens when a reflected signal
gets back to the source and is re-reflected towards the antenna.

Use that information to explain why you can have more forward power
indicated than the transmitter is capable of producing.

: Currents can and will flow on the outside of coax on mobile
: installations They can change the reading on a swr meter.Whether
: parallel or antenna these currents are one component of a composite
: load that the radio sees. This is not a measurement error since what
: the instrument reads is the actual swr on the line.

Wrong. If the SWR meter were perfectly shielded, and the sensor was
perfect, then you would be right - ignoring coax losses. In the real
world, this is not the case.

: A way of decreasing the negative effects of current on the line is by
: a wise choice of coax length. Choose eighteen feet to minimize the
: negative effects of coax currents,

How? The currents are still there. If there is a current minimum at
the rig on the outside of the coax, there is an accompanying voltage
maximum.

: At eighteen feet the voltage curve of these currents drop to zero.

You can't have it both ways - either the current drops or the voltage
does. They move in opposite directions - and the product is always
equal to the amount of rf power on the outside of the coax.

: house. A couple of questions if I may.

I am not Jack, but I can answer.

: What would be the best arrangement for two elements,
: driven and reflector or driven and director?

Always use a reflector first. Add a director if you want 3 elements.

: If the single quad impedence is 100 ohm and adding elements
: lowers it, what would be the feedpoint impedence for two
: elements?

If you place the elements close to other objects, all bets are
off on what the feedpoint impedance will be.

: I have about 6 feet from ceiling to peak in the ceiling space
: so I was going to construct a wire yagi. Richard mentioned a
: "diamond shaped" quad which might get me out of trouble if I
: shorten the vertical spreader and lengthen the horizontal one.
: What effect would this arrangement have compared to a
: "square" quad"?

It will raise the feedpoint impedance a bit. If you had a folded
dipole in free space, the impedance (if I remember correctly) would
be around 300 ohms.

Hi,

I just found this group and had some questions. I am going to buy some CBs. First of all I want to get a hand held to carry with me while hunting, and would like to keep it in the camper also , maybe with an additional antenna. I was looking at the Midland 75-830, & 75-820 or the Cobra 45wxst, & 38wxst. I am leaning towards the Midland 75-830. This is only due to info I have read and not personal experience. Does anyone have any advice on these radios, etc. Are the weather bands on these radios as good as or better than if I would get a separate weather radio? I am also going to buy another mobile but I'll ask about those later. Thanks for any help you can offer.

Actually, the best place is inside the fuel tank. That bothers
some people, however. They forget that the pump and 12 volts to
feed it are already inside the tank.

Don't think dropping the tank is necessary (unless the tank is plastic). The tank itself acts like a shield... it's the wire that powers the pump that's radiating. Put your filter as close to the tank as possible on the wire that feeds B+ to the pump.

The kit is made to install at the pump, inside the gas tank. If you just passed out of warranty, your Ford dealer should give you consideration and do the job for no charge. My truck was 33 mos old and had 45,000 miles on it and my dealer covered the repair. If you want a PDF of the Technical Service Bulletin that covers the repair please let me know. Best of luck.

Waterbug,
Go ahead and ground it. After you do, you should be able
to tell if it did any 'good' or not (maybe). Personally,
I'd ground everything to the frame. That's 'central' enough.
As far as expensive test equipment to determine the 'best'
grounding place, on the face of it, it sounds like what the
farmer puts on his garden... and not 'Miracle Grow'.

If I had to run inside the usual roof (lotsa nails) my main aim in life
would be to lower the near magnetic field to keep the nail-heating to a
gentle ladylike belch. Silly tho it may sound, my first attack (knowing
there ain't really any good solutions) would probably be a folded tripole
fed thru a 4:1 balun with a Q section handy if by some miracle the feed
point was much above 300 ohms.

The input impedance of the universe is 377 ohms. An antenna is a probe, kind of like the nice little pin at the top of the magnetron in a microwave oven. The antenna itself has standing waves, static and magnetic, that surround it like people at the airport waiting for their flight to be called. Every nail in the roof that gets into the magnetic field will sap the system. So the idea is to keep the near magnetic field down. Not much of a theory but the only one in town.

You didn't. You are also correct that getting it away from the roof is the
only long-term solution. I like your suggestion BTW for using the wire.

Being an apartment-dweller these days, I have had a bit of experience with
hidden and goofy antennas. As I am sure you are aware, an 11 meter antenna
is duck soup next to doing it for say 30 meters.

>Quote:"..Anybody out here have any eperience with the New 2950dx radios that...."
We also sell the 2950DX & I was surprised to find that it is now an Entirely "new" radio inside! This radio uses a new "695" circuit board that is mostly surface mount components, with sealed metal covered sections for rcv, pll & xmit. New FET front end & green backlights too. The radio does 10 & 12 meters right out of the box, & a seperate plug-in board would be needed for 11M. (no more moving a jumper!) Expanded range with optional export board is full 24-32Mhz. Seems like the best built & performing 2950 I've seen.....

Cross-posted to: rec.audio.car,rec.radio.cb

Hi folks,

I am in the process of making a portable entertainment center for the truck I drive at work. It will house my CB and an AM/FM/CD car stereo.

I am not the only one to drive this truck, so removal is necessary.

What I am looking to do is add some kind of rechargeable battery inside this box so that when I take it out of the truck I will not lose my presets, clock, or bass/treble adjustments.

1. What kind of battery do I need? I have seen the backup batteries that work inside a home alarm system and figured they might work.

2. How do I need to wire the battery to the stereo harness to allow the battery to charge and provide the stereo with constant power when it's not in the truck connected to the power outlet posts on the dash?

Thanks for the help, email responses appreciated.

It's not a silly question, in fact, it's not a bad idea. The
problem with doing this is that the mechanical strength of that
'spreader' will have to be much greater than the other 'spreaders'.
Depending on the size of the quad (what frequency it's made for),
you can really be getting into a 'can of worms' finding something
to make it out of. I'm sure there are other things to use, but
the only thing I can think of off hand, would be a 'pole-vaulting'
pole, and a very stiff one at that. It'd probably cost more
than a commercially made antenna would(?). Can you think of
something else that might work? (remember...insulator)

Most of those devices have an "always on" lead. If you hook it to a 9v
battery it should hold the memory for a while. This worked on a mobile
scanner I used to use.

I recently put an IMAX 2000 on top of my roof with two lengths of RG 213.
No problems whatsoever. SWRs are low and the thing talks just fine.
RatShack makes a coupler for male ended lengths of coax. YMMV, but it
worked fine for me. Talked to Europe and the West Coast with it this last
weekend.

Yeah, I know. Sorry, I just had to tweak you a bit - I figured the post was kinda teasing some, so I teased back! Seriously, the ONLY reason that happened was that the XO wanted a phone patch - and none of us had the guts to tell him that was too much power. He wanted a patch, the skip was very poor, and we got him the patch!
73s, Jim

4089. external coupling antenna on frs

Newsgroup: rec.radio.cb
Date: 2000-08-31 17:53:48 UTC
From: gilles <guerette@vlsi.polymtl.ca>
Message-ID: <39AE9AB7.873AAA58@vlsi.polymtl.ca>
Source record: 50573

last week I decided to try this:

put some aluminium foil around the antenna of your frs radio
attach the positive conductor to the aluminium foil.

After, cut two 6" of stainless steel whip connect one to the other end
of your + coax conductor and the other whip to the shield

Place these two whip to make a dipole
place a 15" whip at 11 centimeters from your dipole
and you get a 2 element beam.
note the boom should not be metal pipe, take piece of wood
because metal will affect parasitic element.

Of course this system represent a hi swr to you output stage
but it will greatly increase the way to fill all the gaps when
you are in town. Note that the swr will cause to your radio to drain
more current but don't worry about your pwr stage
it will handle with no problem the swr. Don't forget
that your radio have often mic plug beside the antenna, and it cause
also
hi swr when a mike is plugged (example to illustrate the making of swr)

On my side I have obtained very good result with my 2 elements
but I have made a 4 elements to get an extra penetration also
it<s extended a bit the range.

Well Nick, If you just want a great 40 channel cb radio I recomend a Galaxy DX-949. I bought one for my wife and it talks circles around my Northstar which cost three times what the Galaxy did. For a trunk mount antenna the Wilson 1000 would be a real good choice. For around 200 bucks you would have a killer little system that should give you many years of service.

Joe, I found a cap that's inline with one of the tubes, looks to be in poor condition, a good portion of the insulating material is gone. Doesn't check bad to ground with my ohm meter though. I can remove it from the circuit and check it on a capacitor checker we have at work and see if the values are still ok. The previous owner installed a switch between the relay and the ant RCA jack to bypass the relay circuit. In either position the relay still closes upon main power on. With power off, the inline relay isolation switch, (no better idea what to call it) in the open position, center pole has no continuity to ground. When this same switch is closed, center pole has continuity to ground. I'm not quite sure what this means yet, as I haven't had alot of time to spend on the amp as of late. Thanks for all the help, Marc.

97% of those extra freq's is SSB use . the only people on AM that i hear are
mexicans . if that radio don't have SSB , cancel your order get one that does

If you won't be too far from the camper, get a pair or pairs of FRS radios. I've had range up to 2 miles in semi-open areas. If you still want a handheld, Cherokee makes a decent one ('bout the only good thing they make) if it's still in production. Addy is "wirelessmarketing.com". You'll get plenty of feedback on radio selection so I'll refrain from commenting since I have no experience with the radios you mentioned.

Yeah that sounds really great. But you turn off these guys and watch all
the other normal repeaters go to heck in a NY Heart Beat.

The other repeater owners will be begging you to turn it back on. All
the wounderfull 435 users will go to the normal mono tone geek
repeaters. 435 is national resource.

I second that. SSB is superior to AM in both distance and operator class.

What keeps the piece of fiberglass between the tabs of the pills and the bottom of the board on your amp from being any different? All of the strips in Dave's amp are always the same size, how would it cause problems from amp to amp like you say. I mean what are we looking at here? A difference of .5 PF between pieces? Give me a break.

gilles,
An antenna like that is called a passive repeater. CATV used
to do something like this a number of years ago, for communities
with difficult TV reception. It's a long way from being efficient,
but it does work. The 'radio end' antenna only has to be near the
radio, not actually touching, which should not affect the SWR of the
radio's antenna at all.
'Doc

Kenwood TS440SAT.

Best AM out of the bunch.

Then comes the ICOM.

In that order

Yeasu hasn't made a decent AM transmitter since the FT-101 :)

My preferences.

OK

I did a rebuild on a couple Watermelon Man conversions from TS Sweet Sixteens to 16 pills.

Man, what a fromunda those where. Parts wheren't even soldered in ... Just mounted.

Anyway, yeah, if you have it, we will get it working... And don't knock Texas Star.. You heard that damn 8 pill in my burban :)

Newp, I haven't.

I am not going to mess with the RDS-400 at all. It is still brand new.

The RDS-1, I am keeping until I find a virgin 858 chassis AM/SSB (138, etc.). I want it mobile. The 138 would be my first choice.

However... You still likin that 959?

Also consider the Midland 75-810. I use one. Has 40 over and 40 under,
good output and batteries last forever (on standby). This mates to my
2950 and allows us to find a private channel whereever we are.

Thanks Auto Man, I'll take you up on that PDF (do you have it on a site somewhere or could you email it to me?), and give the dealer a call. Didn't realize it was actually in the tank itself!

I'll be impressed if they do it no-charge, but I'll let you know.

Thanks again,
Matt.

:>:If he was licensed and was arrested for a scanner violation then
:>:the only obvious thing that could be illegal is using the information
:>:obtained over the scanner for ones benefit or for an illegal activity.
:>
:>There is another possibility. There seems to be a growing number of
:>stations that are transmitting "number messages" (string of numbers)
:>in and around Chicago. You can hear them on 40 metres and 20 metres
:>in the CW band. I passed a guy up on the Indiana Toll Way who
:>overloaded my receiver with a CW number broadcast. He looked like he
:>was from southern Europe and had ham plates on his car.
:>
:>If this is true, and you must know that there are a number of state
:>troopers in intel units, then the cops may be looking at hams as a
:>cover for spying and terrorism commo. Not a great future for us hams.
:
:Hmmm... those hams are so hot to turn in "outlaw" radio
:operators to the Feds. And now law enforcement is targeting
:hams. How ironic. "How does it feel?"

Those same cops are taking outlaw CB radios from CBers and having them
destroyed. I had the city clerk of Elkhart tell this. The drug
runners are using CBs and scanners to track the cops. The lead
vehicle has the scanner and he radios back to the mule about the cops.
So the cops are taking out anyone with a radio antenna (non broadcast
and cell).
```

26.500 mhz to 27.405 mhz AM. 27.385 mhz, and 27.415 mhz and various other frequencies for the next 20 channels in Band ' F ' depending on your setup in both USB & LSB. Stay below 28.000 mhz. Just listen a bit and you will pick it up pretty quick.

What type of service are you providing? you are selling antennas that are bid on e bay people send you the money then you send the antenna I am confused as to how you are providing a tremendous service to people. I wouldnt call selling goods on e bay over the internet a "service" type business It may make you reliable or trustworthy that you will sell an item when it has been paid for in advance why because it puts cash in your pocket.

Afraid I can't tell you anything about those particular models, but I do have some info to share:
1) Handhelds have hardly any range (if you can't see them, you can't talk to them)
2) Weather bands on CBs work just fine, but make sure you have a local weather broadcast channel (my radio shack TRC-234 and Kenwood TH-79a both pick up a weather station that's about 30 miles away).

Professor you talk like a man with a paper ass You have never seen the inside of a davemade amp because you are now spreading false information...there is no tape under anything in daves amp except the strip that holds the B+ lead that comes into the amplifier and under the relay chassis . None of these would have any effect on any stray capacitance that you are throwing around ... For you to even comment on something you have never seen is quite assinine. And you try to be an intelligent guy but this just makes you look foolish to sit here and argue over something you know nothing about. The arrl handbook even recognizes the exact construction principle on some of there uhf /vhf amplifiers ...

Sir, you obviously have never seen nor worked on a davemade or an xforce amp. there are pill strips which are pieces of 2 oz circuit board machined/punched out at a sheet metal shop which the transformer sits on above ground and the collector and emmiter of the pill is soldered to these strips and they are floating in the amp which means they are not taped down and are held in place by the 10 ohm base resistor, bias choke, input transformer on the input side and 120 pf caps, transformer on output side. No tape except this holds the relay to the board as well as holding down the V+ coming into the amp... You need to reasearch your info before you post inaccurate information this makes you look foolish...

HI

For a list of CB frequencies Visit the U.S Emergency Radio Monitors Website at www.userm.com.tj
then click on the chapter map and go to the NYS chapter website and you'll find frequenices and codes for the Citizens Band Radio. If you go to to theU.S.E.R.M travel and weather site [acessed through the NYS chapter site] you'll find CB radio articles too!

It's setup to operate out of the CB band and/or
with high power.

Of course all they'd need would be an ham radio instead of
CB. This sounds like the beginning of the war on hams. LEOs
think they own the road and will not differentiate

between CBers and hams.

"Service" is providing to the customer what you have promised to him/her in a professional, competent and timely maner. This is true whether you are AntennaWareHouse on ebay or General Motors selling you a Buick at your local dealer. Based on his record at ebay (yes I went and checked this out for myself) seems Tim does an exceptional job at this. The facts speak for themselves. Good job Tim.

4161. New SuperStar Base Station

Newsgroup: rec.radio.cb
Date: 2000-09-01 06:09:13 UTC
From: Bill Nadzam <nadzam@bills2way.com>
Message-ID: <39AF4809.4D08BF7A@bills2way.com>
Source record: 50602

http://www.bills2way.com/equip/images/superstar4900b.jpg

Model 4900B

Cool Features

- 2 Antenna connectors, selectable from the front.
- DTMF encoder and decoder. Sends 1 to 5 DTMF sequence, the other station listens and opens squelch. Cool!
- Split Freq Operation.
- 120VAC or 13.8VDC, but DUMB... can't take off the 120VAC line.
- Accessory jack for Terminal Node Controller, Packet, RTTY, ETC.
- AM, FM, USB, LSB
- Price is Under $300 street.
- The DTMF Pad allows for direct Freq Entry too.

Lots more too....

I am going to scan the Manual into PDF tomorrow.

The deck will have an Acc and a B+ wire.
Depending on the age of the deck, the Acc or the B+ can be the real
powerwire for when the deck is ON (check the fusesize : the 10A fuse (or
just the 'biggest' fuse) is the powerwire.

Depending on which is which, you can either hook it up with or without
protection (meaning you cannot turn it on with the powerplug NOT plugged

into the truck).

In general : put the little (1.2Ah up to 7Ah for small portable 'alarm'batteries) battery at the B+ line. (and put ground to ground of course) this will keep the memory alive.

Hope I wasn't too vague...
Mail for more info (might not answer for a couple of weeks, holidays...)

A CB that can transmit more than 5 watts, or can transmit on any other
frequency (including those between the channels) than the allocated 40 channels,
or use methods other than CW, AM, or SSB. If you use a ham radio as a CB, then
it is considered an illegal CB as would a linear or modulator.

And the truth is indeed funny.
Well, now we know where his expertise is... maybe he'll give us some tips on
hooo's.

These are not commercial amps why do you feel they need to be classified against them they, are "homebrew" cb amplifiers that work as good as anything on the cb market if you want commercial quality you can pay to have him engineer you a commercial quality amp... he certainly has already done this in his career. Wish i could say the same about you.

You are a fake and a fraud Griffey. You know your arguement is bullshit that is why you have no reply since you assume there was tape under some important parts inside because of what you may have heard on the cb NG. If you are a big FET amp designer what the hell are you doing talking on a cb and making illegal cb amplifers surely a man of your "so called knowledge wpuld not waste his time with the rest of us peons you would be in the engineering NG talking with the other BsEE's Your a real Joke ....

4179. INVITATION TO 3 ANTENNA-RELATED LISTS

Newsgroup: rec.radio.cb
Date: 2000-09-01 12:08:22 UTC
From: fractenna@aol.com
Message-ID: <20000901080822.21108.00001514@ng-ff1.aol.com>
Source record: 50620

QST--

You are invited to join one or all of the following lists on e-groups(formerly onelist). All these reflectors are e-mail based, friendly, objective, and moderated ,so that no spam, porn, off-topic, or personal-offensive posts are sent out. You will receive no off-list e-mails by subscribing: again; no spam.

These lists (with average recent subscriber sizes) are:

ANTENNAS@EGROUPS.COM 176 members
CROSSFIELDANTENNA@EGROUPS.COM 70 members
FRACTALANTENNA@EGROUPS.COM 255 members

Please review the descriptions at:

http://www.egroups.com

Please note the CFA list specifically deals with this antenna in an objectively critical fashion and no posts will be allowed that make grandiose claims without supporting data presented. To date, no data has been presented which requires the extraordinary claims made by some pundits: there is no evidence for better performance than any other small vertical antenna (and that performance is poor).

Fractal antenna posts should go the the fractal antenna reflector; not the antennas reflector.

To subscribe to any list, either go through the process at egroups, or to skip the process (and some say 'annoying questions') just do:

---------- -subscribe@egroups.com

where the ---------- is the name of a given list (such as 'fractalantenna')

If you have a specific question on this post, please e-mail me off-NG at chipn1ir@aol.com.

73,
Chip N1IR

If'in ware me I'd by a Ranger 2950DX. Nice radio and can do everything PLUS what the cobra can do. Cobra is just not what they used to be. Look at www.exportradios.com and see what they have to offer. I have used this comapny along with others on this group. Another company that I have dealt with directly is www.coax.kid...really good luck there!

With all of those toys and nice truck I would buy a nice radio to go with it!!

Chip,
why would you spam a newsgroup that
has absolutely NOTHING to do with antenna
design or construction or even modeling.
Please put a end to your activities.
just a comment seems you have made quite
at few friends in the antenna newsgroup
can you wonder why?

I have not changed the subject one bit... the subject is improper design ideas commonly used in DaveMade amplifiers. Sticking copper strips and inside heat sinks are just two that I've seen on his products. By the way... why doesn't he come out here personally and comment on these design flaws. Why does he allow (or does he even know?) an admitted "pimp" to defend his products. That makes no sense to me. I have nothing personal against Dave (it's that's his real name) but I take issue that he continues to sell "prototype grade" units as finished products. I guess in the end there's really nothing wrong with that if you can get some poor sap to buy it. I guess that's where you come in "Game"...

Ok Tim,

At least I know that you deliver what you sell. And that is a VERY good thing there. I really am in the market for a different antenna but am really confused on what type to get. Right now I have a wilson 1000 mag mount on my truck. I really do get good reports from DX stations but my system is changed since then. Here is what I have

2950 driving a Palomar Cobra 4500 (around 400 - 500 peak output..I DO NOT drive the 16 on HIGH I use the lower settings!!) with a sweet 16 at the end of it. My worries is that one with all that added power I will burn the paint and two since it is a mag mount the ground may not be good enough for all that power either.

4186. Lou Franklin's "Screwdriver Expert's Guide" book

Newsgroup: rec.radio.cb
Date: 2000-09-01 13:30:04 UTC
From: dbb
Message-ID: <rf9vqscd9jcsdpi45a7vsmfb9vg6gak7dc@4ax.com>
Source record: 50627

This book certainly seems to have been written by a radio expert.
However, I came across what appears to be a contradiction. On page 24
he states that with a loaded antenna, the loading coil radiates almost
none of the CB radio energy and that it's the "straight part" that
radiates the signal. However, in the next paragraph he states that
the strongest signal radiates from the point on the antenna where the
RF current is highest, and on a loaded antenna that point is at the
loading coil. I assume he means the strongest signal radiates from a
point on the straight part closest to the coil?

Using a ham radio as a CB is just as illegal, so there's no difference there. As far as cars with antennas, the antenna is dependent on the frequency used, not the type of radio, so they would still have to use a CB antenna, even with a ham radio. At any rate, they'd have a hard time justifying a stop based on the simple fact that you have an antenna on your car. Where's the probable cause?

As is often the case, if someone does something they don't like they
can always charge them with disturbing the peace. I think that's what
was used in this case, but unsuccessfully.

Probable cause? My God, man, where do you live? Probable cause went out years ago. The LEOS do what they want with little fear of reprisal. I was stopped in Va. near Fancy Gap a few years ago on I-77. Reason I was stopped? Too fast for conditions. I was going well within the allotted speed limit which was 55 in that particular stretch, there was a blanket of snow, and the cop said I should have been going under the speed limit because of "conditions". I received a ticket for with a box checked on the ticket that said "Too fast for road conditions". Instead of writing anything in where it said "speed", he left it blank. Could I have fought it? Yes. Would I have won? Probably. That meant having to return to Va. from Fla. at a later time for a court date. (Sigh) I paid the ticket ON THE SPOT and it never even made it to my home state DMV.

Your worries are well founded. Running that kind of power mandates that
the antenna mount have a direct connection to ground. You could stick
with the Wilson's (I'd use the 5000) if you want to stay with a
unobtrusive antenna, you just need to use a roof mount style.

Tim, for low power radios (less than 50 or 60 watts peak) just working the regular usa cb channels, is there any advantage to the Wilson 5000 over the 1000? From the Wilson ads showing the 1000 tested against its compatition it might even seem that the 1000 would rx and dx better than the 5000 using the above parameters. BTW I am talking mag mount in case that influneces things. TIA Nick

Uh, no. I have talked to many a person with the rubber duck on my radio. They were usually about a mile away or so but I could talk to them just fine. An external antenna is a must for long(er) distance communications. Some rubber ducks work ok, some are just rubber dummy loads.

Professor, Contrary to your statement, design flaws can only be determined when a product is used in the manner for which it was designed, by the end user. Bashing technical things like stray capacitance (4 picofarads), that do not affect the band the amps operate in, does not constitute a design flaw. The end user will ultimately decide if the product is better or worse than the one it competes with. Dave has brought a revolution in CB equipment that has spawned a new breed of builders, technicians, and end users. No longer do they have to depend on truck stop shops or rag paper outfits like Coppers to get something. The quality, performance and longevity of this new breed of amps has made name brands the last choice of end users. In the aftermath, a lot of builders and technicians got out of the game because they couldn't produce amps with competitive performance or price. The choices of the buying consumer helped make all this happen. Like the old saying goes; The customer isn't always right, but he is always the Customer. And as true as that statement rings, it will always be the Customer who determines the acceptable level of quality of the product.

Can't help it if big audio is mistaken for power. Heheheh! Besides, you know the weekend thing is only temporary. And, with all those wire inventions of yours you sound like YOU'RE the one with megawatts when one gets in front of that dipole. I know, I know, you can't help it if that trashy barefoot mobile tram steps on a few bases. Gettin' up!

I agree Frizz. Hooked my Midland 75-810 up to the Wilson and it performed as well as any other 4 Watt radio.
The rubber ducks Midland ships with their handhelds closely resemble dummy loads though.

Rubber duck antennas on plastic handhelds are useless at 27Mhz, the gain's average 20-60 Db below a dipole.-
Other than line of sight or over water forget it.

I had a metal Layfeyette Dyna Com years ago that did 4 -5 miles with a 6 foot 1/6 wave telescopic and 12 AA batteries
that was the only time I had any range with a 11 meter handheld.
The clip on ducky resulted in a drop of 7 S units at 2 miles
The Cobra 45WXT is cool looking but has no rang with the ducky, its good for the beach, amusement parks or shopping malls.
The weather band operates around 162.55 Mhz easy capture with a 4 inch antenna

ok tell me by experimentation how many degrees difference the m80 is out side of the his chassis vs the heatsink inside the chassis . It is gonna be 0 . How many have failed after probably 10+ years of service because of it being in a case 0 and if the number was 1 it would be 1 more than you have ever sold. Griffey you could not hold a candle to dave when it comes to rf, antennas or electronics in general that is a sure thing.

4217. Pickup antenna mount

Newsgroup: rec.radio.cb
Date: 2000-09-01 20:46:50 UTC
From: "Robert L. Brewster" <rbrewste@sstelco.com>
Message-ID: <8op4c8$e9j$1@ionews.ionet.net>
Source record: 50708

Can anyone give me some advise on mounting an antenna on a shortbed extended cab pickup. I want to mount it on the bedrail behind the cab. Have found two mounts (stake mounts) on the net, one is way to expensive $65 and the other is only good for a 4 ft antenna. I plan to get the wilson trucker 2000 and a mast long enough to put the loading coil above the cab. Is there something else out there without drilling holes. Any help would be appreciated.

Thanks
RLB

You are flawed again when you say sticking copper strips they are not stuck anywhere and it is an accepted practice in the ham community if you like i will e mail you the information. Do you actually think dave even knows or gives a rats ass about what you have to say on a cb NG.He doesent need to impress you or any one else his products do that for him. How can you even think to call his amp a prototype unit it is made better than all the other cb amps that are sold out there, all his circuit board parts as well as chassis, including the pill strips are punched out at a machine shop not hacked with a file, drilled, nibbled or anything like lots of the other amps on the "CB" market.. Why would x force who has done very well using his design, and construction practices fair so well if they werent made well, even after #12 had his opportunity to change what he felt may be wrong or make it better he didnt change a thing. If He and dave were togther you couldnt even stand in the same room as them.

Professor I am not defending Dave, I am attacking you simply because you whine about shit that is not true. I said I was a Pimp, at least people laughed at my post, people rolled their eyes at yours and thought "what a puss" You make out to be an RF guru, well you your self should know that his method of building will cause no more stray capacitance than your way. By the way you reply its your way or no way. Nothing you build is complicated. Your all wind. Keep building one pill prototypes and selling them and leave the keydown market to someone who can handle the job. By the looks of your one pill it is nothing fancy in any way, shape or form.

When they hold keydowns here in Hawaii, there is a seperate class only for dave mades. You will never see a dave made key up with a texas star or any other amplifier pill for pill. About 6 out of 10 people here run dave made. Tells you something about those dave mades.....but then again, we are in hawaii and we are slow to catch up to the mainland 48 states.

4221. Re: Lou Franklin's "Screwdriver Expert's Guide" book

Newsgroup: rec.radio.cb
Date: 2000-09-01 21:39:56 UTC
From: Eric Oyen <n7zzt@home.com>
Message-ID: <39B022D0.907956D6@home.com>
Source record: 50712

A coil represents a load (more to the point, it allows a
physically smaller antenna to approximate the electrical length
of the full sized 1/4 wave.

In most "end-fed" 1/4 wave groundplanes, the current node is
usually at the antenna tip. In the case where a load coil is
placed and the antenna is tuned to properly length, the current
node is still at the tip.

In the case of a firestik antenna, the entire length is essentially a
coil with increasing turns per inch along its entire length. This
design could be considered a "variable impedance transformer"
and it does tend to work very well given physical size.

dbb wrote:

Although the coil itself does radiate... it's certainly not the major
radiating element!

use a mirror mount....just the angle part. drill 2 holes in the inside bedrail and mount it about a foot or so behind the cab.....it will look better right up against the cab but won't work worth a hoot and the swr will be high....

Greetings!!!
I just helped one of the neighborhood kids put up a Solarcon A99 on his roof, and I had a question as to what would be a very "cost effective" type of coax...

You see, he's only 13 years old and doesn't have a lot of money...
His Dad passed away, and left him with a Cobra 29 Classic, and his mother gave me the OK to install the A99 for him...

We need at least 50 feet of coax... Would the cheaper RG-58 suffice for him, or the Mini 8? And is there a big difference between the two???

Thanks to all, and have a great Labor Day weekend!!!

A.K.A. "G-Man" on AM, 551 Chicago on SSB...

G-Man:

I would personally go with the RG-8X (Mini). 58 is lossy, and MAY (not
will, but might) cause interference from bleedout. Make sure
everything is well grounded, and put the RG-8X up. I personally feel
it's worth the few extra cents a foot.
But that's just my two cents.

Why would you say you were a pimp if you were not? That was supposed to be
funny?
I don't know why you'd be embarassed to tell me the truth.
Seriously... what is your real profession?
I want to understand what your qualifications are to speak on this topic. We
are not really discussing Dave here... just the design that he puts his name
to. As for me building uncomplicated amps... yes that's true! I find that
over-complication and gimmicky stuff has reliability problems so I attempt
to avoid that pitfall. I'm not out to impress the world with 29 pills for
keydowns... I just a very reliable amp to talk to people with every day.

Actually, 13.8 is what I test amps at for: "Daily Driver" use...

But close enuff to 14 in all practicality. When I know the guy has a good alternator, I will bring the thing up to 14.4 . That way, my numbers are ALWAYS repeatable, within about 10 percent.

That's provided it's not a tuned input/output...
On an amp like that you can see about 70% efficiency.

4244. Burying Coax.....

Newsgroup: rec.radio.cb
Date: 2000-09-02 03:28:11 UTC
From: Frizz <senorpurpl@hotmail.net>
Message-ID: <8ops6f$451$1@bob.news.rcn.net>
Source record: 50737

OK, I need to get away from the covenant nazis and install an antenna in one of two trees. The first tree is about 40-50 feet or more from the house while the other one is about 12 feet from the house. I am going possibly with the one farther out since it is higher and in more free space but both installations will need to have buried coax. I need to know what is the best way to bury some parts, or maybe all, of this coax since it is going to be in an area that could get bothered by lawn mowers, animals, etc. Is it best to make a conduit (kinda hard to do for me) and if so out of what? Or is there a cable that will fair well underground without one and if so, what is the best way to just bury this type. Any suggestions are appreciated. Thanks!!!

If nothing is visually fried I suggest the following. Feed a small current... through a resistor (100 Ohms @ 14V) to the bases of each module seperatly for several seconds and monitor the current to the whole amp. You will have to lift one end of any chokes on the bases before doing this. Leave the 10 Ohm base resistors in place. (If you have no base resistors... you will have to increase the value of your test resistor to perhaps 560 Ohms.) By doing this you can check each push-pull module to make sure the transistors are conducting. You should see a draw of perhaps several amps during each module test and both pills in that module should get warm. It sounds to me like you have one or more bad devices.

>>>>So the cops are taking out anyone with a radio antenna (non broadcast
>>>>and cell).

2==> In New South Wales, am pretty sure that it is illegal to transmit
any information that obstructs police activities. For instance,
warning other road users of a speed trap, portable truck weighing
setup, random breath test unit, etc.

>>
>>>What is an outlaw CB? Since they dropped the Licensing requirements a bunch
>>>of years ago..
>>
>>Something about legal frequencies and power, perhaps.....?

3==> Licensing requirements dropped for both HF and UHF citizens band
services some years ago in Australia, but users still have to use a

set that meets adequate technical specs, sticks to original frequency allocations and power levels.

4257. Re: Burying Coax.....

Newsgroup: rec.radio.cb
Date: 2000-09-02 05:34:48 UTC
From: sideband <sideband@cac.net>
Message-ID: <k541rss21ti4j421963qdte299vr2iquae@4ax.com>
Source record: 50748

My brother owns an Invisible Fence franchise. When installing the "antenna" wire around the property (used to transmit a signal to a pet's collar to keep them in the yard), he uses a gasoline powered wire burier. Pretty neat little deal. He used it over at my parents' place to bury the coax for their DirecTV cable, with no problems. If there is such a franchise in your area, you might give them a call and ask if they'd come out and bury some coax for you. They'd prolly do it for a nominal fee, and the coax would end up a good 3 feet deep, and both ends would come out where you want them to. No problem from the lawnmowers, etc...

Worth a try, anyway.

-SSB

On or about Fri, 1 Sep 2000 23:28:11 -0400, "Frizz" <senorpurpl@hotmail.net>, using the forum rec.radio.cb did say:

:OK, I need to get away from the covenant nazis and install an antenna in one
:of two trees. The first tree is about 40-50 feet or more from the house
:while the other one is about 12 feet from the house. I am going possibly
:with the one farther out since it is higher and in more free space but both
:installations will need to have buried coax. I need to know what is the
:best way to bury some parts, or maybe all, of this coax since it is going to
:be in an area that could get bothered by lawn mowers, animals, etc. Is it
:best to make a conduit (kinda hard to do for me) and if so out of what? Or
:is there a cable that will fair well underground without one and if so, what
:is the best way to just bury this type. Any suggestions are appreciated.
:Thanks!!!

Which is illegal in itself as FCC regs specifically prohibit coded transmissions. I wonder (doubtful) if these stations are IDing? Spy transmissions seems unlikely on HF given the state-of-the-art in satellite commo technology, and even cel phones seems like a more secure method of transmitting code. Any chance of this being CW practice of some sort?

If he has a choice, go with the 8x. I agree with Doc, use whatever to get
him going, he can save some money and upgrade his coax later.

Use RG-213. it has the good jacket and its a quality coax... 9913 is
also good but it would be overkill at 27 mhz.

Why do code practice sessions via a car??

The disadvantage of Satellite (ie INMARSAT) or cell phones is that it
IDs the person who is receiving the message. And sat comms and cell
phones can be tracked. HF number broadcasting only exposes the
sender. Which is why the use of ham equipment and mobile ops (that is
how I would do it). I am only telling you what hams in the Elkhart
and Mishawaka area have told me (a one over in South Bend). The toll
road has become a huge radio range with everyone using radios for some
type of illegal business. It has the cops upset.

The Ultra-right and Aryan Resistance guys have gotten rather
sophisticated and yes while cell phones could/would do the same thing,
it's common knowledge that these devices are insecure for these groups
and others. If communicating to one's partners that are incarcerated the
number station route is the method of choice. Prisoners are allowed
radios but not phones.

I own the wilson 1000 mag mount and love it!! The really is no gain to running the 5000 over the 1000 unless you plan on smoking the airwaves. I am going to have to upgrade my getup because of some "added features" on my mobile rig..I am going to dump the mag mount and add a 5000.

From: MC 10kW Jesus <qsl27@hotmail.com>
Message-ID: <39B13CDD.3E66DBEA@hotmail.com>
Source record: 50771

All will work, but I'd go with the one that has tbe best outer
shielding. Many RG58 coaxes are weak in this area. However, the Times
Microwave LMR195 is just like RG58 but is 100% shielded. The loss on
50ft is going to be very low at 27MHz and it really doesn't justify
paying a premium for big pipe.

I agree, i didnt read the original post and didnt realize it was a 13 yr old
but if $10.00 or so +/- can save him from bleedover and get a better grade
of coax why not use it now because when its up in the air and he starts
transmitting and there is a problem and the neighbors come complain to his
mom what do you think she will do at 13 he will either have to get off the
radio altogther or hope he has some one to help him. Just a suggestion. I
saw 10' of rg8x at radio shack for $9.99 that is 1.00 per foot including the
crimped on cheapie connectors, I am sure a 50' run of rg 213 or equal can be
found for .36 to .65 per foot. Especially with the antron which are know to
cause rfi already. It seems like everyone would rather overkill the power
wire say like run a 0 or 2 guage power cable for amps that draw minimum
power than use a better coax where you will gain a benefit of performance
and some insurance that you have a better shielded coax working for you. As
Hillbilly said it may not make a discernable differance to the human ear,
just the same as if you used 2 ,4 or 6 guage wire for a 35 amp draw
amplifier but it may make the differance to your neigbors ear in rfi
insurance .

I didn't reply to this because I thought you were kidding!
Are you serious when you don't understand that any heat sink has to have air flow going over it to be effective. If you put a heat sink in a nearly closed box with virtually no air flow... it will not be able to dissipate any heat. How's that for making it simple. And don't tell me that the M80 heat sink doesn't get hot... I've seen several... and they get hotter than hell!

So to answer your question... a heat sink will run much better outside the chassis that inside!!!! Oh... by the way... the two I have seen failed from this problem and I had to repair them. I told their owners that it would most likely fail again because of the excessive heat.

Yes. Much more than you do, I suspect. The amateur licence prohibits
the use of a cipher.

>1==> Nothing new about these stations that broadcast cipher groups.

Don't you believe it! The CIA/MI6/Mossad/Cuba and other assorted
spymasters broadcast on HF to their spies abroad, in morse, AM
and SSB. Known as numbers stations or illicit stations. I thought
someone posted to the effect that Amateurs were broadcasting these
numbers - as you say illegal.

Like you, I question why on earth they want to do this in this day
and age. Best answer I got was that the spies were in 'developing
countries' which didn't have satellite or Internet.

*In article <20000829122449.11711.00000094@ng-md1.aol.com>,
*hamm4fun@aol.com (Hamm4fun) wrote:
*
*> When in the "FORWARD" configuration they are able to capacitively
*> measure the ALGERBRAIC SUM of the forward and reflected voltage at
*> the point where the device is inserted. It also measures the ALGERBRAIC
*> SUM of the forward and reflected current inductively at this point in a
*> like manner. It then using Vector addition combines the current and
*> voltage to give what many oversimplified explanations call forward voltage.
*
*That's a pretty good description. Where did you find that?
*
*I'm not sure why they consider the voltage and current sums to be
*algebraic and not vector but that is not a big deal.
****

Why someone would want to algebraically add/subtract a current vector and a
voltage vector? Now the dot or cross product of the two will yield something
more uselful. Divergance and curl is more important the the addition or
subtraction.

****
*In short, what you measure is the sum of four signals:
* forward voltage
*+ forward current
*+ reverse voltage
*+ reverse current
*-------------------------
* resultant meter reading
*
*
*To be a little more accurate, it should be noted that the meter is
*designed for a specific characteristic impedance such that the
*signals from the current sensing are equal to the signals from
*the voltage sensing.
*
*Thus, you could look at it like this:
* forward voltage
*+ forward current * Zo
*+ reverse voltage
*+ reverse current * Zo
*-------------------------

* resultant meter reading
*
*Since (forward current * Zo) = forward voltage, we can perform a
*substitution.
*Also, note that (reverse current * Zo) = -(reverse voltage).
*The reverse voltage and current are 180 degrees out of phase.
****

The phase of the reflected voltage vector or current vector is determined by the reflection coefficient of the load. If it is less than zero and equal or greater than -1 then and only then will the phase of the relected voltage vector or current vector quantity will be 180 degrees out of phase of the incident vector quantity.

****
*Substituting, you get:
* forward voltage
*+ forward voltage
*+ reverse voltage
*- reverse voltage
*-------------------------
* resultant meter reading
*
*Simplifying, you get:
*resultant meter reading = 2 * (forward voltage)
****

If the reflection coeffiecient were equal to +1, then 100% of the incident voltage would be reflected back to the source. Thus if the measurement point were at a maximum, then the sum of the incident and reflected voltage vector quantities will equal 2 times the incident vector quantity. If at a minimum then the resultant will be zero. Now leaving the pickup point in the exact same place as above and only changning the reflection coefficient from +1 to -1, the resultant voltage from a vector addition of the incident and reflected voltage vectors will be zero. A minimum. Once again the measurement point remains in the same location and the reflection coefficient is changed to zero, the resultant voltage seen will equal to that of the incident voltage. Thus this is what a simple RF voltmeter would see at a specific point. One can measure SWR with a RF voltmeter by moving the measurement point along the transmission line untill a voltage maximum and minimum are located. At that time one has enough knowledge to calculate the SWR on the line.

It is easier to measure SWR by sampling both the incident and reflected wave at a single point in the transmission line.

regards
James

****
*Thus, the meter has been able to separate out the forward voltage
*by summing the combined voltages and currents.
*

*By the way, note that the meter is designed for a specific
*characteristic impedance, Zo. It is expecting a particular
*relationship between the voltage and current in order to
*operate accurately.

Galaxy 77 HML and Palomar Elite 400. Both look and WORK GREAT! Will peak at 425 watts using standard alternator and battery and a 102" steel whip. Hate to sell but need the cash. Selling both together for $250.00 and buyer pays shipping. Email me at intimidator33333@hotmail.com if interested. Thanks

Because that is what the sensor does. "Vectorly" can be substituted for
"algebraically". The examples I had were for a purely resistive termination
where the algebraic addition would be OK.I forgot to mention this. If the
sensor is designed properly the voltage induced by the Current will be equal to
The voltage capactively couple to the probe and the two will cancel when the
probe is in the reflected postion. They will add when in the forward position.
This is all you need for SWR. The voltages obtained are just raw data. By
adding them you get a voltage reprensative of 2E and by subtracting them you
get 2I. What more would you want to know about them?

*This bridge circuit is not what is found in a typical SWR meter.
****

Wattmeters today use a variant of the Bruene Bridge circuit or some form of dual directional coupler. The variant of the Bruene bridge places a second set of capacitors in a divider on the load side of the rf transformer. The resistor is then split into two with respect to ground. Balance adjustments are critical with this type of bridge. With the detector placed on the load side of the bridge the bridge is balnced for refleclected voltage and thus only detects forward voltage. Placing the detector on the source side the forward voltage is balanced and only the reflected voltage is measured. As can be seen this is a difficult circuit to balance. In calibration the transmission line's characteristic impedance must be equal to both the source and the load.

The dual directional coupler is more disired. It can measure both the current and voltage of the incident and refelcted waves at a single point in the transmission line. There is not the dificult balancing problems with a bridge. The dual directional coupler works well due to the fact that the current and volatge vectors are orthogonal, (perpendicular), to each other at the point of insertion into the transmission line. There are two voltages that result from a dual directional coupler. One is a resultant from the incident current minus the reflected current. The second is a resultant from the sum of the incident and reflected voltage. With these two quantities the SWR can be calulated. By calibrating detectors one can directly read SWR from the above quantities.

The bleedover is not caused by leaky coax. It is caused by the coax having common-mode currents on the shield. This is because the A99 has no provision for decoupling the antenna from the line. Easily done by coiling 5 or 6 turns of the feedline into a 6 inch coil at the antenna. Actually I would suggest not putting it up for him, a 13 year old kid should have better things to do.

If there is no fan blowing on a heatsink whether inside the chassis or not how much cooler is the one outside ? You are guessing and have not done any experimentation with the amp. i have one and will get another out of the chassis both will be keyed into a dummy load for 3 different tests at 1,2,3 minutes and temperature readings will be taken of the heatsink of both of them. the m80 has one whole side open for air ventilation where the air comes in top and flows across the board down and out thru the fins. And for some reason i knew you would say you seen 2 of them and had to fix them. What was your fix ? I would also assume the heatsink would get hot thats its job, rf is being produced which causes heat what do you expect it to be cold?. You seem to remember them quite well correct? Tell me a little about whats inside so i can compare it to mine ...I remember a few pictures that were posted to NG a while back that has the m80 keyed while in a container of water, can your amps do that?

I have the same senario. What I intened to do is use a length of 1" square tube to span the width of the bed right at the cutouts for the stakes. It will have to go to the outside edge of the bedrail on either side. Then drill holes in the tube to put "J" bolts(probably have to fab. them) through the tube down into the stake hole and catch the other factory hole on the inside face of the stake box. No holes drilled in the bed or pick up. Then I can mount my 1/4 wave whip to the tube. It won't be right on the front of the bed but pretty darn close and nothing is damaged . I will probably put some kind of gasket material or rubber under the tube where it contacts the bed rail to keep from scratching it. Also, probably the famous tennis ball on the antenna to protect the roof of the truck. I hope this makes sense, if not just send me an email.

Esentially the same voltage exists at idle and at keyed... about 0.65V. This allows about 150mA collector current depending on the beta of the individual device.

Professor, the copper strips you are referring to are 3/4"x3/8". There is no way a strip of copper board that small will have more than 15pf of capacitance. Keep in mind all of these strips are the same size. These do not affect the outcome of the amplifier. There is already a cap going to ground on the same strip. This cap is a collector to ground cap. Not a real critical cap, it can be a few pf different than the on next to it without any problems whatsoever.

I am an electrical contractor, this has nothing to do with my electronic credentials. I am a diehard electronic junky for fun. I work to make ends meet. I do my hobbies for fun. I have met people that went to school for certain trades or skills that could not hold a candle to the guy that learned through hands on, real world training. I can tell you this though. the strips you have been referring to do not cause instabilities like you have assumed. My job has afforded me enough test equipment to make this claim truthfully. I never did disagree with you about whether or not it was a "proper" building method. I know that the large ground plain he achieves by doing this is a hell of good idea.

4314. Questions on Johnson 800mhz 2-way Radios / CB

Newsgroup: rec.radio.cb
Date: 2000-09-02 22:41:20 UTC
From: system66@my-deja.com
Message-ID: <8orvmehbb1@nnrp1.deja.com>
Source record: 50904

Hi, i'm thinking of getting a couple Johnson 800mhz 2-way radios, but I don't know anything about 800mhz radios, so I thought i'd ask the experts. I'd appreciate any advice on this subject.

To me, these 800mhz radios seem like CB radios, but are more like Ham radios in that they are powerful, 50-150 miles. But, I think you need to access repeaters to use them like with Ham radio. But you don't need a license for 800mhz radios? These radios are also cheap compared to getting a couple Ham radios.

Please correct me if i'm wrong, as I don't want to buy these and not be able to use them. I would like to get a couple to use in the cars, and maybe one for home as a base. Is this possible or am I wrong about all this?

Thank you!

Professor,
I'm thinking 50 feet will be enough...
I was going to run his coax down the side of his house, (It's hidden from view because of the fireplace chimney.)
and go into his basement where I already set up his radio for him... I donated a 7 amp power supply for him, that should power up his Cobra 29 just fine...
There's already a hole drilled where the old Cable TV line entered the house into the basement...

>How long is the coax "run" going to be?

A.K.A "G-Man" on AM, 551 Chicago on SSB...

:>> in "code" thus the broadcasts you've been listening to.
:>>
:>
:>Which is illegal in itself as FCC regs specifically prohibit coded transmissions. I
:>wonder (doubtful) if these stations are IDing? Spy transmissions seems unlikely on HF
:>given the state-of-the-art in satellite commo technology, and even cel phones seems
:>like a more secure method of transmitting code. Any chance of this being CW practice
:>of some sort?
:
:Don't you believe it! The CIA/MI6/Mossad/Cuba and other assorted
:spymasters broadcast on HF to their spies abroad, in morse, AM
:and SSB. Known as numbers stations or illicit stations. I thought
:someone posted to the effect that Amateurs were broadcasting these
:numbers - as you say illegal.
:
:Like you, I question why on earth they want to do this in this day
:and age. Best answer I got was that the spies were in 'developing
:countries' which didn't have satellite or Internet.

Satellite and the internet allows the tracing of who the message
is sent to. HF does not. The receiver is totally left out of the
picture. At best, the transmitter can be traced which is why these
folks go mobile with ham licenses.

:--

:>>>>>:>in the CW band.
:>>>
:>>>Why would they want to broadcast a bunch of numbers?
:>>
:>>Are you just being deliberately dense, or do you not understand
:>>ciphers?
:
:Yes. Much more than you do, I suspect. The amateur licence prohibits
:the use of a cipher.

The license forbids jamming but hams have done it.

What it looks like is that foreign nationals or those loyalities
to other countries are getting ham licenses as a cover. Then
broadcasting number messages to whomever.

I do not think the right wing is this smart. But even then this is
a bunch of hams guessing as to why we are seeing (hearing
actually) so many number stations on the toll road east of Chicago.

:>1==> Nothing new about these stations that broadcast cipher groups.
:>As most veteran SWLs can tell you, they have been operating for
:>decades.
:
:The only numbers stations I know of are the illicit CIA/FSB/Mossad/MI6
:(and other evil organisations) which broadcast instructions to their
:spies.
:
:>>>>What is an outlaw CB? Since they dropped the Licensing requirements a bunch
:>>>>of years ago..
:>>>
:>>>Something about legal frequencies and power, perhaps.....?
:>
:>3==> Licensing requirements dropped for both HF and UHF citizens band
:>services some years ago in Australia, but users still have to use a
:>set that meets adequate technical specs, sticks to original frequency
:>allocations and power levels.
:
:Eggsackly. Mind you, all CB-ers are illegal IMHO!

What scares me is that radio is becoming like guns. Something
that is being used for illegal purposes. And that could be scanners,
```

CB, ham radio, even FRS. The drug runners are using scanners and CBs. Spies may be using ham radio. And then there are the militia movements.

Why can't people just behave!!!

I've got a Wilson 5000 (trunk mount) on the hood, opposite the trk radio antenna. I tried the 2000 years ago and returned it the next day. The 5000 is a great antenna. I've got a 99 toyota 4x, with an extended cab and short bed. I park my trk in the garage and have no problems driving in and out of the garage with the antenna.

Well here goes.....
Go to your local muffler shop. Tell them you want to
have them make a type of antenna bar, kinda like a
roll bar, but out of muffler tubing that will fit inside
the stake holes. Once they made that, have them
weld on a piece of angle iron with a 5/8" hole.
Presto..... an antenna bar that has the antenna
over the top of the cab, doesn't have to drill holes on
the outside of the bed and is removable. You will have
to drill some holes in the inside for mounting, but what
the hell.

4322. Re: N9VKS: Indiana ham arrested for having a scanner/the follow up

Newsgroup: rec.radio.cb
Date: 2000-09-02 23:18:49 UTC
From: 2121d@gte.net
Message-ID: <39b18858.36759323@news.gte.net>
Source record: 50911
Cross-posted to: rec.radio.amateur.misc,rec.radio.cb,rec.radio.scanner,rec.radio.shortwave,misc.survivalism

I contacted the Elkhart city clerk (the Bremen State Police Post
files all their traffic tickets into Elkhart). What happened was that
Josh Church had to go back to court a second time to show proof
of having a ham license. At that point all charges were dropped.
Case # 20H01-0005-CM-05634, Illegal possession of a police
radio-monitor-scanner, IC 35-44-3-12

As I expected, there was only one appellate case on this section
of law, and it only dealt with the possession of a radar detector
(radar detectors are not assumed to be police radios so case
dismissed). As of yet, no one has raised a case to a higher court
that would define the limits of the law.

What concerns me is that we are seeing an increase of people using
radios, as guns were used before, to commit crimes. Drug runners are
using scanners and CB radios in chase vehicles to let the mules avoid
the cops. So the cops are now stoping anything with an antenna on it.

And it looks like someone in the Chicago area is using their ham
license to cover a spying network. Too many in the Gary-South Bend
-Mishawaka-Elkhart area are hearing mobile ham stations trainsmitting
number type broadcast, in and around the ham bands.

Therefore the cops are looking hard at anyone with a radio. Even
hams. I do not like having to prove that I am a good guy. Even
volunteer fire fighters are now getting the "evil eye". In a society
where no one knows anyone else, everyone is looked at as dangerous.

Too many young cops (average cop only stays on the force for 5 years).
No connections to the community like the old timers had. Too gung ho.

And too many bad guys using my hobbies (guns and radios) to violate
our communites. Somehow we hams need to make our skills available
to the cops to help stop the crooks.

::snip
::
::If he was licensed and was arrested for a scanner violation then
::the only obvious thing that could be illegal is using the information
::obtained over the scanner for ones benefit or for an illegal activity.
:
:There is another possibility. There seems to be a growing number of
:stations that are transmitting "number messages" (string of numbers)
:in and around Chicago. You can hear them on 40 metres and 20 metres
:in the CW band. I passed a guy up on the Indiana Toll Way who

:overloaded my receiver with a CW number broadcast. He looked like he
:was from southern Europe and had ham plates on his car.
:
:If this is true, and you must know that there are a number of state
:troopers in intel units, then the cops may be looking at hams as a
:cover for spying and terrorism commo. Not a great future for us hams.
:
:Hello everyone, I just seen this post about this particular ham being
:arrested for having a police scanner in his automobile. Considering
:that I
:live in Indiana and go under the call of W9SUN which is my FCC
:assigned call
:sign for usage in the amateur service, I would like to make a few
:comments.
:I have read the law from the state of Indiana regarding possession of
:a
:scanner. It is not illegal for an amateur radio operator to possess a
:scanner in the state of Indiana and use it in a mobile setting. The
:key to
:this is that state law says that an amateur operator who has been
:granted a
:license from the Federal Communication Commission can possess one as
:long as
:they are a current FCC licensee. As for myself, I often carry a
:scanner with
:me whereever I go just for the hell of it. Anyone in Indiana can have
:a
:scanner in their house but in a car is a different story. For you to
:be able
:to activate a scanner in a car you must have either approval according
:to
:state law or something like being an Amateur Radio operator. So I
:think what
:this really comes up to is that either he was doing something else
:illegal
:or just a dumbnut officer who didnt know what was going on. Stuff like
:this
:needs to be checked out by the ARRL and the FCC and the locals and
:state
:officers need to be informed of the laws, not just make arrests based
:on
:possession. Its about as silly as being stopped for having an antenna,
:I
:guess that maybe they think people are using police radios. It would
:be that
:a 2 meter antenna would be very close in frequency to the police bands
:here
:locally. Down below I will post the actual law as found in the Indiana
:Code.
:So I think that this is either regarding to other illegal activity or

:just a
:cop that didnt know his head from his rear. Thanks for your comments.
:
:IC 35-44-3-12
: Sec. 12. (a) A person who knowingly or intentionally:
: (1) possesses a police radio;
: (2) transmits over a frequency assigned for police emergency
:purposes; or
: (3) possesses or uses a police radio:
: (A) while committing a crime;
: (B) to further the commission of a crime; or
: (C) to avoid detection by a law enforcement agency;
:commits unlawful use of a police radio, a Class B misdemeanor.
: (b) Subsection (a)(1) and (a)(2) do not apply to:
: (1) a governmental entity;
: (2) a regularly employed law enforcement officer;
: (3) a common carrier of persons for hire whose vehicles are
:used in
:emergency service;
: (4) a public service or utility company whose vehicles are
:used in
:emergency service;
:
:
:---
:----
: (5) a person who has written permission from the chief
:executive
:officer of a law enforcement agency to possess a police radio;
: (6) a person who holds an amateur radio license issued by the
:Federal Communications Commission if the person is not transmitting
:over a
:frequency assigned for police emergency purposes;
: (7) a person who uses a police radio only in the person's
:dwelling
:or place of business;
: (8) a person:
: (A) who is regularly engaged in newsgathering activities;
: (B) who is employed by a newspaper qualified to receive
:legal
:advertisements under IC 5-3-1, a wire service, or a licensed
:commercial or
:public radio or television station; and
: (C) whose name is furnished by his employer to the chief
:executive officer of a law enforcement agency in the county in which
:the
:employer's principal office is located;
: (9) a person engaged in the business of manufacturing or
:selling
:police radios; or

: (10) a person who possesses or uses a police radio during the
:normal
:course of the person's lawful business.
: (c) As used in this section, "police radio" means a radio that is
:capable of sending or receiving signals transmitted on frequencies
:assigned
:by the Federal Communications Commission for police emergency purposes
:and
:that:
: (1) can be installed, maintained, or operated in a vehicle; or
: (2) can be operated while it is being carried by an
:individual.
:The term does not include a radio designed for use only in a dwelling.
:As added by Acts 1977, P.L.342, SEC.1. Amended by P.L.162-1994, SEC.1.

I agree with <cough> "The Game".
50' of RG213 including ends installed should run you about $35-40, money well spent. For that matter, 50' of Times LMR 400 would run $10-15 more, even better spent.

No... the trimmers will stay. They are necessary to optimally tune each individual unit for maximum output power/efficiency due to component variances.

The problem comes in where the strips vary in the distance from the main ground. The closer they are... for a given size strip... the higher the capacitance can be. You never know what the reactance will be because of variances in tape thickness. If the tape is thin... you could possibly see several hundred puffs for the size strip you described. Like I said... this may be a nice way of throwing something together quickly for testing purposes... but not for a production item.

OK... glad you responded. I'm glad that you have found that the strips haven't caused any problems for you. However, I'm only saying that a potential for problems will exist when this method is employed at RF frequencies. If we were talking about an audio amplifier... I would have no problem with a construction of that nature.

Hello JR: You ham radio boys are always thinking like a dime holding up a dollar. If the kid has good coax to his antenna he can up grade to a better antenna in a ah heart beat with the good stuff. Especially if he gets a big linear.

There's a good reason the FCC fired up the CB radio Service!

The difference in cheap coax vs good coax ain't that much, and allows him do what ever he wants in the further. If he wants to sell the hole how-raw the good coax is easier to sell.

I wouldn't wrap my trash with RG58 or RG8X.

In the early 1970's in a back street with a broke down delivery scooter loaded with electrical wire harness's for a local Aircraft Manufacture, I rescued a fellow worker, we towed the scooter back with good RG214 coax as a tow rope, the cheap crapp wouldn't do. The moral of the story is: One must always be prepared, ah? Use the good coax and always ground your tower.

Jay in the Mojave.

You DO need a license for 800 Mhz service. Many, if not most 800 Mhz
radios also operate on trunked systems.

This is definitely NOT the least bit like CB.

OK... unless he is figuring on running a lot of power (200W+)... the
difference in the two cable types you mentioned is perhaps 1dB at that
length and the losses will be minimal.

"TheGame" <TheGame@yahoo.com> wrote:

"Why would x force who has done very well using his design, and construction practices fair so well if they werent made well, even after #12 had his opportunity to change what he felt may be wrong or make it better he didnt change a thing. If He and dave were togther you couldnt even stand in the same room as them."

Dan was a builder for DAVEMADE (not like you didn't know that but...) some of the amp designs he built for DAVE was re-invented by him and #12 with a biasing system thus making it X-FORCE (besides Dan leaving DAVEMADE for personal reasons). If you think about it, someone mentioned earlier that DAVE's boxes were homebrewed. It's not a patented design so in all practicality, all other boxes aren't really copied. Just made a little better or worse. Personally, I'd rather see BLACKSTONE Boxes reproduced (nothing against any other boxes made). Maybe it is like the COOKIE line...

I don't know... I really am getting tired of the whole DAVEMADE hype though. Although I own one (DAVEMADE M400), I'd like to see more of other competitive names on the winners circle like Crockets old 2112 design, BLACKSTONES, MUSCLEMAN, and the rest of the old boxes. DAVEMADE is the most innovative to date in RF amplification design but, I'd sure like to see more techs out there to bring up the competition line of brands.

Just my two cents...

Paul,

What you need is any of the Uniden line of radios. Stay clear of the newer Cobras. If you are going to buy any Cobra radios, buy older models; not anything post 1998 with the stupid SoundTracker crap installed. I would more than likely advise you to pick up a Uniden GrantXL or GrantLT. Nevermind about watts because it is the audio that'll get over the noise level and Uniden Grants do that with stock microphones already.

As far as antennas, the Wilson line is very exceptional. Magnet mount type Wilsons are easily ready to be removed and or replaced.

Scanners on the other hand, I wouldn't mount one. In CALI, its illegal. Use a handheld scanner if necessary.

Have fun with your set-up and don't do anything to jeopardize yourself against federal regulations. If you decide to make CB radio a hobby, well, have more fun!!!

I have a Teaberry Twin "T" 23 channel am/ssb base station for sale, it is in good condition, and works fine. The only problem is the volumn control level is "fixed" and the RF gain is used to adjust the listening level. It works just fine. Comes with a hand microphone. $45 + shipping
Please email direct if interested

Good grief, we're talking about 50 feet! The RG-58 would work
as well as anything would, cost probably half as much, and you'd
never know the difference. If he knew for sure that he would be
staying with the hobby, that would be one thing, but for a 'starter',
why bother?

:>What concerns me is that we are seeing an increase of people using
:>radios, as guns were used before, to commit crimes. Drug runners are
:>using scanners and CB radios in chase vehicles to let the mules avoid
:>the cops.
:
:Bull. You can't offer ANY proof of that.

That is what the cops are saying. Go ask Trooper Brant Clam, the PAO
of the Bremen Post. Or talk to the Elkhart city clerk. That is what
they are arresting people for. Using CBs and scanners to avoid
detection by the police. Look at this thread. Several people have
reported being stopped by the cops for having radios, all because the
drug runners are using them.

:>And it looks like someone in the Chicago area is using their ham
:>license to cover a spying network. Too many in the Gary-South Bend
:>-Mishawaka-Elkhart area are hearing mobile ham stations trainsmitting
:>number type broadcast, in and around the ham bands.
:
:And BECAUSE it's in 'or near' the Ham bands,
:you assume it's somone WITH a Ham license??

No, because I personally saw a guy with ham plates
blow by me, jamming the front end of my receiver with
a number type mesage in CW on the lower end of 20.
Others upstate are reporting the same thing.

:>Therefore the cops are looking hard at anyone with a radio.
:
:The Cops wouldn't know a numbers station if it was transmitting
:in their car!

There are a number of ISP troopers who are also military intelligence
analysts in the Guard or the Reserves. I would expect that they have
some exposure to signal intelligence.

:And they have LITTLE authority to do anything about it even if
:they find such a station.

They can gun you down if you mouth off. It is called resisting
arrest.

As I noted in a private e-mail, the amateur bands probably aren't too prone to official monitoring for content. In most cases, CW acts as a cipher even for amateurs, if sent at sufficient speed. It would be good cover. A mobile will serve to confuse RDF monitoring and the band mentioned (14 mHz) is open world-wide almost all day and night.

Whatever, there is no tape under the collector strips on Dave's amps, and
none under the base either. If the was a difference of a 100 pf is
impossible. Take a cap tester and see for yourself.

I agree that if the distance between the ground and the top of these varies
there will be a slight difference in capacitance, but ever Davemade I have
seen did not use the tape under the device tabs, only on the relay and the
power strip behind the output xfmr's. The slight variance in capacitance is
minute, no more than a few pf at worst. I've tested it and stand behind it.
I used to feel the same way about the strips and different sized areas
etched out for the pill tabs. It will cause a problem if the difference in
size is noticeable, but Davemade amps seem to all be the same to me.

> *algebraic and not vector but that is not a big deal.
> **********
>
> Why someone would want to algebraically add/subtract a current vector
> and a voltage vector?

The answer was there. It is because the reflected voltage and
current are out of phase. Thus, they will cancel each other
out when added together with the forward voltage and current.
Thus, a directional reading is obtained; it shows the forward
signal only.

> Now the dot or cross product of the two will yield something
> more uselful. Divergance and curl is more important the the addition
> or subtraction.

What are you talking about? What is important about the divergance
or curl of the voltage and current measurements?

[snip]
> *The reverse voltage and current are 180 degrees out of phase.
> **********
>
> The phase of the reflected voltage vector or current vector is

> than zero and equal or greater than -1 then and only then will the
> phase of the relected voltage vector or current vector quantity will
> be 180 degrees out of phase of the incident vector quantity.

Not true. By definition, reflected voltage and reflected current
are always 180 degrees out of phase and they are related to each
other by the transmission line characteristic impedance. That is,
Vr = -Zc * Ir.

If the voltage and current were somehow in phase, as you claim
they could be, the power is moving toward the load. Reflected
power moves toward the source; not toward the load.

When you mentioned the terms "dot or cross product" and "divergance
and curl" above, I thought maybe you understood their relevance.
If you did, you'd know that the cross product of the electric
and magnetic vectors provides the direction of the power flow
(a.k.a. the Poynting Vector). If the current and voltage were
somehow in phase, the power flow would be toward the load not away
from it.

The load reflection coefficient does determine the *net* current
and voltage which is the sum of the forward signal and the reflected
signal. This is because that reflection coefficient affects the
magnitude of the reflected voltage and current and their phase
relationship to the forward voltage and current. The reflection
coefficient does *not* determine the relative magnitudes or phases
of the reflected voltage and reflected current to each other;
that is determined solely by the transmission line characteristic
impedance.

Yes.

Yes.

Yes, but who can do that with coax? That would be a trick.

What is the physical dimensions it looks large for a 1 pill device. I know
you are using a deeper sink but the width and length look very large
compared to a Mod V or Dave M 80.

My dealer has provided the fix on three vehicles while under warranty.
According to the diagrams Ford recommends an in tank install. But if I had
to do it myself I would try it externally and shorten the ground as much as
possible before I dropped the tank.

Please people...those of us here that have experience with both sides of
the dope trade are just plain laughing right now.

Domestic drug numbers stations based in Indiana
and using mobiles on CW???

Hams being arrested or detained???

Drug runners in and around the ham bands???

And the cops in Indiana are stupid enough to believe it???

First off.....
The Indiana cops probably turned the musings of a tweaker (meth user)
into a pretty tall tale, after finding a CB in his truck after a search
and arrest.

Second...
NO drug cartel worth a 10 spot of crack is going to use CW (smoke
signals) to move the product around in the states. If they are stupid
enough to use a ham radio then they must really be amateur.

Third...
Ham radio operators make crappy drug runners. Do I really have to
qualify that.

Fourth...
Felix Areallano and his brother can afford to buy encrypted astros from
Motorola S.A de C.V. with no questions asked if needed.

> :>And it looks like someone in the Chicago area is using their ham
> :>license to cover a spying network. Too many in the Gary-South Bend

> blow by me, jamming the front end of my receiver with
> a number type mesage in CW on the lower end of 20.
> Others upstate are reporting the same thing.

Or just another idiot jammer...
>
> :>Therefore the cops are looking hard at anyone with a radio.

At the most the cops are dealing with a major meth problem in the
midwest and some of the tweakers have been arrested and in possession of
some box with a mic attached...the word spread among the patrol ranks
that "the tweakers were on CB"(big surpass eh).

When the DEA and FCC start pulling over cars with antennas then you
MIGHT have something to really worry about.

There are plenty other reasons why this is nothing more than a fantasy
in it's current form.

I'm not saying that radios are NOT used...but any decent smuggler knows
the proper use of radio equipment and freq spectrum for any give
task.

Remember they have a lot more money and resources than the Indiana cops.
Except for the tweakers...they are poor and stupid.

If you put a "tweakers suck" bumper sticker on you car, they would most
likely leave you alone.

> :The Cops wouldn't know a numbers station if it was transmitting
> :in their car!

Yah Huh....they have a special doggie for that.

> There are a number of ISP troopers who are also military intelligence
> analysts in the Guard or the Reserves. I would expect that they have
> some exposure to signal intelligence.

They can probably tune in a signal and listen...but the military is not
really trained real well in drug interdiction, let alone domestic drug
interdiction. The fact the police have those people on staff does little
good if the PD does not provide monitoring hours and a shitload of
equipment.
>
> :And they have LITTLE authority to do anything about it even if

Dealing with RFI, the coax shielding is the least of the
problem sources. A few coils making a choke at the base of
the antenna should take care of any RF on the shielding.

-----clipped------

You've already go the kid up-grading antennas and running
an amplifier! He hasn't even started yet. So far, everything
has been either a 'gemme' or whatever's laying around. If he
already has '58 or '8x, why go to the bother of buying premium
cable when he's net even sure he's going to stay with it? For
50 feet, there's no practical advantage to using more than '58
of '8x.

I am sending this to you personally and I hope you don't mind. As a former cop I can say N9NWO is correct. Recently on I-70 on the west side of Indiana, state troopers have busted a few major narc trucks. In two cases the back-up officers noticed one car sitting on the side of the road. Both had what they call a K-40 (I think) whip antennas and in both these incidents the back-up officer called into dispatch to have these cars checked out. By the time a third officer arrived where these cars where pulled off on the shoulder, they were gone. Something else to ponder: One of the trucks stopped contained about 1500 lbs. of coke worth about $18 million. Now it's not that hard to imagine some sort of _insurance_ would be included with that amount of money involved.

Let's see. Some one rides around listening to a scanner.
Cops don't like it so they, what, steal (they call it confiscate,
sounds better to them) the scanner, or they arrest him (for what?).
If there is no case there is no case and there is no law
that would stand up in court against listening to a radio,
any kind of a radio. If they believe he's involved with

drugs, then they must prove it (or bribe an informer).

Some states had laws against CBs in the 1960's. Just
took 'em right out of the car and smashed on the road. Same
with radar detectors. And now they're starting to pull the
same thing with Hams.

The first thing to understand is that if the cops really thought
drugs were involved then they could take the license number, put
a tail on him and he will eventually lead them to witness
something illegal. But to pull people over and take radios
or charge them with some "offense" means that they have
resurrected the old policy. They're after the Hams because
they are easy pickings and represent the worst of the "evil"
public, they can communicate.

LEOs are first and foremost, elitists. They like the idea of
being different and able to do things and know things
that the average person does not. They also crave power,
the gun and the shield. They also like knowing the badness
of the public because their original motivation to become
a cop was to eradicate the bad guys. Soon they begin believing
that they are "the thin blue line", the only ones on the side
of good and that the bad guys are the civilians.

Hams are another group of elitists. They like the idea that
they are privileged characters just like the cops. But they
don't have the same amount of power as the LEOs. Since drugs
have now been linked with radios, radios are targets and
privileged radios are the easiest. They get points for this
stuff you know and the Feds pay each jurisdiction money for
Federal "violations".

Since there is no real law against radios, the state/local
policy could be changed by the Governor or AJ in a matter
of hours. They won't because of the political points and the
Federal payoff.

Then there would be a bunch of dead cops, if that was the
case. What's the use of insurance, if they are not going to
use it? To verify the cops scored 18 million?

Hello Doc: Sure Doc there's all kinds of practical advantage, its called doing it right the first time. Its the American way.

The difference in price is a investement in common sense, it will payoff in the long run. You won't be up on the roof in a year or so replacing the
cheap stuff. And a year or so after that replacing it again. Its cheaper and better doing it right the first time.

You know like listening to Rock & Roll, wistling at a pretty girl, shootin
out street lights, drag racin, talkin ah little skip on the CB Radio, bad mouthing thrid world nations, & playin baseball. Yeah you know the American way stuff.

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station. Miss Dinah down at the fillin station got ah new old Juke Box, and boy do all them old tubes sound great playin both kinds of music!

Hello Bob: Yeah this sounds like a good call, good advice Landshark.

I made up a sheet aluminium "L" or 90 degree bracket, and installed it at the upper aft location on the cab of my little Nissan truck. And installed
a 96 inch Francis Amazer Fiberglass Whip Antenna.

On my Ford F250 4X4 I just drilled a hole in the top of the cab, and mounted a Francis Amazer, yeah it hits all kinds of low hanging objects but it gets out pretty well, but then again CB Radio performance is high
on my list of priorities. I don't worry about how it looks, just how it gets out! Makes ah pretty good racket going thru the drive thru's, and such, but people know then that you are truly a Super CB'er type ah guy.

Suggest you mount the antenna smack dab in the middle on top of the cab, people will accept ya drivin over curbs and stuff easier when ya need to.

Jay in the Mojave

Yes... that is a must to be able to acheive the following:

Best input SWR
Best efficiency
Best power output

The dimentions are about 4"Width x 3"Height x 6"Deep.
With only about 40W maximum being dissipated in the the sink... it runs nice
and cool in operation... just what you want to have maximum reliability.
This is due to its high efficiency. The other two amps you mention are
dissipating about 100W in an inferior sink.

Correct!
That PCB was originally intended to be used for a Motorola (EB63) 2pill
design...
But that board was really never slated to go with that heatsink... but it
fits perfectly.

Good question Mod Squad....I have never seen ANY OF DAVEMADE'S AMPS from his one pill on up USE a tuner inside the box. Why is that??? Is it because his boxes are already tuned perfectly. I always wanted to know that.
btw the workmanship is very clean in proferssors one pill. good job.

Well, if they wouldn't use humans, then maybe the insurance would work. No one knows who these guys are supposed to kill. Maybe they are just supposed to kill other drug runners. The only thing I can say is that it would be somewhat hard to get in a gun battle from your car without practice. I mean you have cars doing 70+ and your going to pull up behind a cop who is already alert that there could be a chase car and start shooting?

> To verify the cops scored 18 million?

Sorry, www.starnews.com ran the story, but their search engine is not bringing it up.

> Guess the spotters didn't work very well, did they??

They are not spotters, they are cars that stay behind. Well I guess they could spot cars coming up the interstate, but they stay a mile behind. The reason I heard was that there were originally used so that the occupants in the drug car would not give hugh sentences because no guns would be found in the drug car. Who knows the truth. I bet drugs don't even exist and the pigs have used sugar in every single photo of confiscated cocaine!!! Yea that has to be it. Just like NASA made up going to the moon to get more funding.

> Drug dealers would have to be totally stupid to use easily visible spotters
> and easily monitored freqs for the spotters.

They are only 'easily visible' because they pull off the side of the road. Also I have heard NOTHING about using ham radios, they use CBs. They stay on channels that are not normally used. I for one see no reason to lie, I mean our state cops said there are chase cars and your opinion is that they make it up for money could be true, but when your state is not going to give you more money then why keep making it up? Let me guess, you think at some point some off-duty cops will shoot one of their own to make this look like a chase car? Then the cops will get their money. Yea I bet that is it.

> Cops will say ANYTHING that helps them get extra funds, and I say that
> having several good friends who ARE cops.

Yes, but they are not getting funds. So when some cop gets shot by a chase car I am going to demand an internal investigation because it's probably other cops shooting their co-workers cause they need and want that money so bad. $18 million and you people act like this is total fucking bogus and no one would

ever do this. Well if I fucking had just a few hundred dollars I would be packing. The thing is I would be defending my life if someone tried to take my money, no fear of jail (as long as the gun grabbers don't get their nazi gun laws passed). These guys who are in these chase cars (and your right, it may be a total lie) have to take into account that they will murder a cop. It would be totally premeditated so that means death penalty here in Indiana.

With fully automatics vs. his 9mm pea shooter? Yeah.
Especially if it means losing 18 million dollars of someone
else's drugs/money.

Well this is why I am getting out of the job. I don't like the attitude you describe and your right, it is there and it's getting worse. I cannot believe it but some of my co-workers favor the assault weapons ban. However I also disagree. I do see myself as the thin blue line. I mean why the fuck don't more people take care of things themselves. Without us, people in major cities wouldn't know what to do. Everyone in m.s. wouldn't need police. However I often wonder when I get calls of a man beating off in traffic why there are no civilians around to help enforce the law? I mean in some areas (mostly rural) people would come out of their houses and take care of the problem. I guess that's why I would much rather work in a rural county than a city, however the money is usually in city police work. Why? Because most citizens are sheeple and don't want to take care of things themselves. I understand it's my job to take care of problems, but when citizens keep brushing everything off they freak when the cops talk blue flu, etc. Damn I don't know what half the people in Indy would do if the cops walked off the job. I guess for some people we are that blue line, for others were are there for assistance, but they know their protection lies in their own hands.

G-Man,

If you're going to limit the run to 50 feet, the most
cost-effective way to go would be with the RG-8/95/MiniFoam.
Install the antenna so that the feedpoint is at least 37
feet above ground for optimum results. A 50 foot run directly
to the equipment once inside should work nicely. At 50 feet
RG-58/U/AU becomes noticeably lossy at 27 Mhz. At the height
above, near-field interference should be minimal. The addition
of the GPK-1 ground plane kit will enhance not only the system
performance, it will also further attenuate local rfi levels
as well.

HR 2510 is almost mint with mounting bracket, and stock mic, box, manual with freq mod, 9 1/2 condition. $150.00

HR 2510 a bit rough as the display has some blotches on it, sort of from the inside, and the following mods have been done to it: NB switch is now hi/low power, Mic Gain is non functioning, PA switch now locks rit to transmit (but doesn't work right so I don't use it), and original mic has an intermitant short. Comes with mounting bracket, non original thumbscrews, very short power cord. Finals have been changed to high power, freq mod has been done, Ext speaker and PA speaker outputs have been changed to mini jacks, comes w/box. $105.00

D104 desk mic amplified fair shape wired for 2510 $30.00

Cobra Hand Held Power mic (older style) wired for 2510 $25.00

Tempo RBF-1 SWR/Power meter 200-2000 watt scales $25.00

Messenger 175 A/B-1 mobile amp w/receive preamp, hi low power, SBB/AM $50.00

Vista 12 Amp continuous power supply $30.00

Lafayette 21-C mic (looks like turner +2) wired for 2510 (has hum) $10.00

Antron 99 cut for 10 meters $35.00 in box

Wilson 1000 w/5000 element, two whips, cable got a little damaged but still functions whips are cut for 10 and 11 meters $30.00

2 Heathkit HM-102 PWR/SWR meters 200-2000 watts range,one complete and mint, another complete but no meter (for parts) with manual BOTH for $60.00

I accept PayPal or Post Office Money orders, you pay shipping from Los Angeles area. Everthing works and is in use daily and will not be DOA, but no warranty after that.

******

As in all phases of electricity, to produce maximum transference of energy from one circuit to another the impedance of the two circuits must match. When the transmission line does not match the load impedance, not all of the energy fed down the line flows into the load. Some is reflected back, forming standing waves on the line. At every half wave point along the line, high-E and low-I points appear. Halfway between these points will be low-E and high-I points. The ratio of voltage across the line at the high-E points to that of the low-E points is known as the "Voltage Standing Wave Ratio", or VSWR. The SWR is also the ratio of the current of the current values at the high and low points on the line.

When the load impedance matches the line impedance, there will be no standing waves. The current at all points along the line is the same. The SWR is 1:1 and the line is said to be flat. "Changing the length of the line will have no effect on its SWR".

If standing waves appear on an antenna transmission line that should be flat, it is necessary either to change the transmission line impedance until it matches the antenna or to change the antenna impedance until it matches the line. This is important if optimum transmission or reception is desired from an antenna.

I agree with you. I would never just "stick" a cap in an amp. There is
always a "sweet" spot, its fine tuning that pays off in the long run.

You sir are full of it... like a "holiday foul" !
There is enough double-sided foam type tape all over the place in every DaveMade I have seen to open a 3M outlet branch store. It holds what Dave is using for circuit connection pads (copper strips).

Ok wise guy... if Dave is not using tape to hold these strips... then how are the strips staying in place? Is he using magic? Maybe he's using old chewing gum? So what then??

I agree, I have an 8 pill that was built in the mid 80's by Dave for 333, it doesn't have tape under the strips.

Yes... this is a high "Q" circuit and requires a fine adjustment. Once they
have been adjusted, they never need to be tuned again unless the transistor
was replaced.

I was referring to transmitting on the CB bands. I doubt that someone using a ham radio would bother dialing the power back to the CB-legal level. The fact that most ham HF sets put out 100 watts and is not limited to transmiting only on the 40 specific "channels" or frequencies reserved for the CB service is probably the reason they're using them as CBs to start with. Either way, it is illegal to transmit on a CB frequency with non-type-approved equipment, and illegal to transmit on frequencies not assigned to the amateur service with an amateur-approved radio.

:> LEOs are first and foremost, elitists. They like the idea of
:> being different and able to do things and know things
:> that the average person does not. They also crave power,
:> the gun and the shield. They also like knowing the badness
:> of the public because their original motivation to become
:> a cop was to eradicate the bad guys. Soon they begin believing
:> that they are "the thin blue line", the only ones on the side
:> of good and that the bad guys are the civilians.
:
:Well this is why I am getting out of the job. I don't like the attitude you describe
:and your right, it is there and it's getting worse. I cannot believe it but some of my
:co-workers favor the assault weapons ban. However I also disagree. I do see myself as
:the thin blue line. I mean why the fuck don't more people take care of things
:themselves. Without us, people in major cities wouldn't know what to do. Everyone in
:m.s. wouldn't need police. However I often wonder when I get calls of a man beating
:off in traffic why there are no civilians around to help enforce the law? I mean in
:some areas (mostly rural) people would come out of their houses and take care of the
:problem. I guess that's why I would much rather work in a rural county than a city,
:however the money is usually in city police work. Why? Because most citizens are
:sheeple and don't want to take care of things themselves. I understand it's my job to
:take care of problems, but when citizens keep brushing everything off they freak when
:the cops talk blue flu, etc. Damn I don't know what half the people in Indy would do
:if the cops walked off the job. I guess for some people we are that blue line, for
:others were are there for assistance, but they know their protection lies in their own
:hands.

I live in West Lafayette. We have guidance counselers here that push
the idea that the military is for losers because "our children are
going to college, let the losers serve". The left wing pushed the
idea in the '80s that if the educated elite just paid their taxes then
the government would raise their kids (ie the teachers, look at the
mess schools are now because parents do not want to get involved),
that the poor and the working class could be bribed to be the military
and the police, that the poor could be made to "disappear". That
taxes equal caring (we now have many elite who want the government
to take care of their parents so they will not have to be "involved").

Look at what the Indianapolis Star published on 911 call abuse. One
guy called to have the police come down and help carry boxes to his
car!! The elite feel that the police are their servants. Yet they
also are afraid of the police and military because they see them as
lower class people who know more about guns and such. It might be
getting thru that if you hand off personal responsibility to another
then that person might someday rule you.

And the military and police are superior to most civilians. Smarter, better physically fit, more ethical (look at how unethical most liberals are).

>The addition
>of the GPK-1 ground plane kit will enhance not only the system
>performance, it will also further attenuate local rfi levels
>as well.

The GPK-1 will INCREASE rfi !!!! As I said before, the minimum I'd use would be Times LMR 240, and wrap coax 8 turns around the mast pipe 6" below coax connection to antenna. THAT will be your best results of lessening rfi to neighbors.

4409. Antenna Testing

Newsgroup: rec.radio.cb

To answer your question; no you don't modulate your radio while testing antennas. Use a fixed carrier with the same watt reading in each antenna. It is better to use a radio that has not been tuned or modified. If you are testing in someone else's mobile that has tuned his radio to his antenna, then you may not get a fair comparison between the two antennas. His antenna may be 60 ohms and your antenna may be 50 ohms. If he tuned his radio to his antenna, then your antenna will always show less field strength.

I agree that there is NO TAPE UNDER them! NOW, but maybe it was before your time, The strips that the transformers are soldered to had tape under them in the early days, that is not the case now of course! and I am not trying to start another 150 messages to debate this fact, but I know you have the phone number, make the call! that is where this whole mess started from. If you look bact to the first message, I was the one that answered his question, I was under the impression that he may have been looking at one of the earlier amps that had the tape, and in my answer to him, I was mearly stating the fact, that it in no way will the tape hurt the performance of the box. as far as I am concerned Dave can tape the pills in place and I will still take a Dave made over anything else that I have seen out there.

>
>Peekaboo they are all exactly the same because they are machined with a cnc
>machine each and every one of them. As you said you have actually seen them
>there is and has never been any tape under them...

Cowboy,
It's as easy as the last 3 numbers on your driver's license! I'm "019"
outta Ventura, CA. I run a Cobra 148 (1990) in the mobile and both an RCI
2950 and a Cobra 2000 on the base. Wilson 1000 for the mobile and a Maco V58
on the base. I hang on 38 lsb and 6, 11, and 19 on AM. I'm not even gonna
bother to list all the other radios I use, at times. Seems as though there's
a different radio up to bat on my station weekly. ;-)

Hello,

Since short I own a Turner 254 HI-Z Microphone.
I would like to know if I can hook it up to modern tranceivers or do I have
to make a modification to the mike to get it to work?
It transmits but does not give any modulation.

Wow... though you were Dave for a minute.
Well... if I'm wrong about the tape... then the two M80's I saw must have
been counterfeits.
Just how does Dave attach those strips to the main board then? Nobody has
answered this question yet!

QUALITY!

There's NO substitute for quality. If you do some serious shopping around and ask the BIG boys on the band what they run you'll see for yourself. The Firestick II & Wilson 1000 are great antennas, But for another $20 you can get a Wilson 5000. The 5000 is 10 times the antenna the 1000 is. Why? QUALITY! Look at a cutaway view of the three antennas mentioned and you'll see for yourself. I hope this answers your question.

the majority of the serious dx'ers on 11 meters belong to a dx group that issue numbers as well as have contest, dxpeditions, iota activations and thiongs like that. there are quite a few good groups but also just as many bad ones that are out to make a profit. the 11 meter callsigns are issued with our own dxcc system, each dxcc is numbered 1 thru 341. check out http://www.irdx.org or http://come.to/limadelta for two of the finest world wide groups.

Well, call it what you want, but it sums the voltages and currents
while maintaining the phase information; it isn't merely adding two
magnitudes. In this respect, I'd have to call it a vector addition.

> A dual directional coupler in fact measures the vector sum of the
> inicident and reflected voltage vectors at the first port...

This is either misleading or just plain wrong. The directional
coupler measures the vector sum of the incident voltage, incident
current, reflected voltage and reflected current. The reflected
terms cancel out (since they are 180 degrees out of phase) and this
leaves a value directly proportional to the forward voltage.

The mere sum of the incident and reflected voltage vectors provides
the net voltage at that point -- a measurement that provides
little information for deducing at the SWR.

> ...and at the second port measures the difference between incident
> and reflected current vectors.

Pretty much the sam story as above.

> Each will develope a power across a known resistance. Thus at
> the two measurement ports will yield a calibrated power that can be
> used to measure SWR.

How do you compute SWR from the net voltage and net current
measurements alone? I see no way.

That occurs when the reflection coefficient is a positive real number.

The reflection coefficient could be a complex number. In that case,
it could be a positive number and the minimum will occur someplace
other than 1/4 wavelength from the load.

[snip]
> Now if we look at the minimum and when the absolute value of the

> the net power at that node is zero.

With a reflection coefficient of 1, the net power all along the
transmission line is zero. The reflected power equals the the
incident power. The sum, forward power minus reflected power, is
zero at all points.

> Now at the maximum, we would have maximum power, either the voltage
> vector or the current vector must be in phase at that point. We then
> have twice the power.

No, the power has not changed. The power is constant all along
the line in both directions. How could it not be? Power must be
conserved.

At the minimum node, you have zero voltage and double current;
at the maximum node, you have double voltage and zero current.
How is that "twice the power"? It isn't.
The power has not changed.

> added vectorally by the pickup.

Those articles are right on the money. Can you be more specific
where the articles are found?

> I am not sure of how the forward and reflected voltage and currents are
> added.

It is really very simple.
First, to sample voltage, all you need is a small capacitance coupling
to the transmission line. The voltage obtained can be rectified and
fed to a meter for display.
Note that this measurement displays a value that is proportional to
the net voltage at that point. That is, the sum of the incident
voltage and reflected voltage. There is nothing directional about
this component of the measurement.

Second, to sample current, all you need is a small inductive coupling
to the transmission line. This senses the current to provide a voltage.
The signal obtained can be rectified and fed to a meter for display.
Note that this measurement displays a value that is proportional to
the net current at that point. That is, the sum of the incident
current and the reflected current. There is nothing directional
about this component of the measurement.

Then, these two signals are summed together. Since the reflected
voltage (one part of the first measurement) and the reflected
current (one part of the second measurement) are 180 degrees out
of phase (opposite), they cancel each other out and the net reading
is for forward voltage and current only.

As simple as (I hope) this seems, it is even simpler than that.
It is possible to build a single probe that is both capacitively
and inductively coupled to the transmission line. Thus, the entire
single-direction measurement is made with one simple probe and
one detector circuit. This is what most typical SWR meters do.

> The notebook examples I had from a class showed them algebraically.

On paper, algebraic and vector addition look no different. They
both use a '+' sign.

> I have a problem with this. If at the voltage nodes they are in-phase
> and at the anti-nodes they are 180 out-of-phase then between these
> two points they should be somwhere in between the two. I always
> thought they should be vectorally added instead of algebraically.

Good thinking. BTW, even all scalars have a corresponding scalar
that is 180 degrees different; it is the negative of the scalar.

You will not see a noticable difference in performance for antennas
that are virtually the same length. The Wilson1000 should be perhaps 5%
better (non-detectable) because it's another foot or so longer that the
Firestik. As far as MonkeyMade... if it's of similar length as the ones
we are discussing... then it has no real performance advantage either.

The majority of people use numbers that they make up themselves. Being as so many groups are issuing them etc. there will always be the chance of some overlap anyway. Just listen for a while in your area to make sure that you don't pick a number somebody else is already using.

To get my number, I joined a local group for about $5US for a lifetime membership, and they hold a daily round table whenere you can call in etc. They also hold flea markets and offer members special offers on equipment etc. so it is well worth it for me.

Equipmentwise, I run a Uniden PC122XL with a K-40 antenna on the trunk of the car, and when conditions are right, I can talk from up here just north of Toronto in Ontario, Canada all the way to California, Flroida and even Antigua !!

Have fun with the SSB.

Richard.

The 5000 can be tuned for operation between 25 - 30Mhz. But I wouldn't use the same whip, use different whips for different bands. Your swr will be crappy if you don't. On 11 meter my swr is 1.1 to 1. When I tried to use the same whip for 10 and 11 meter my swr was up to 2 [unacceptable]

4456. Re: One LAST SWR Question - references

Newsgroup: rec.radio.cb
Date: 2000-09-05 18:45:57 UTC
From: hamm4fun@aol.com
Message-ID: <20000905144557.28937.00002423@ng-ch1.aol.com>
Source record: 50991

ARRL reference is 15th edition of the ARRL antenna book chapter 24. They go into much detail on SWR. ALot more than you will ever know or need.

The FAA reference is from their Common Principles course. While I was in the Air Force I was among a lucky few tht got shipped off to the FAA acadamey in OKC. It was terrible. Lived off base, went to school in civies. We were suppose to check in once a week at Tinker AFB, a phone call sufficed.

It is an excellent radio. IMO, so is the 949. More features in the 949 but
a, possibly, more stable ssb experience with the 122XL. You cannot go wrong
with the 122 if space is an important cosideration.

Jeff

Come on now Toll, you need to get a copy of any ARRL Antenna Handbook and read up on things a little more.

: Toll Free <tollfree@bigradios.com> wrote:
: The coil tends to act as a choke, and the higher up the choke is, the better
: the performance.

Wrong, first you have to know what type of antenna the design is trying to be. In the case of the first thread post, this guys probably asking about a classic base loaded coil antenna. Base loaded antennas with one stinger often emulate 3/4 or 5/8 wave antenna lenghts. Coils in the classic antenna are used for electrical shortening of the physical antenna and impedance transformation. Often, they are feed with a "tap'd coil" method and you may see a small cap included in the feed to cancel some reactance.

A lot of the actual radiation is off the stinger and the important thing you all overlook is the angle at which the signal leaves the antenna. Some antennas are better at ground wave and some are better at skywave.

: This is due to the fact that the radiation is below the choke.

It is not choke...

: The "stinger" serves little other purpose than to add capacitance to the L,
: causing a tuned circuit.

Wrong, a classic base loaded antenna has a metal stinger to simulate the physical top portion of the antenna. You adjust it's physical length to adjust it's electrical length. Depending on the type of feed point, you might see a small capacitor at the feed point, but most often it's a fixed amount.

: Therefore, the higher the choke (coil), the more shaft under it... More
: shaft = more radiation.
: Toll Free

Wrong,
For the most part, anytime you see a coil in a base loaded antenna, you can consider it part of a method to electricly shorten the antenna. There are some "trick" electrical lengths which get real close to the required 50 ohm feed point. These are the classic 5/8 and 3/4 wave versions. Often part of the function of a coil is to also transform the feed point impedance. The ARRL Antenna Handbook explains these handy electrical lengths where the coil does the job with ease. The current and voltage points on the antenna are shown in very nice diagrams.

When you start moving the coil up toward the top of the antenna, it's function starts to change, depending on location and circuit design. Often coil-cap combinations are used to seperate frequency ranges (like the classic tri band ham beam). Other uses as mentioned before are to physical shorten the antenna.

The 5/8 or 3/4 wave base loaded antenna is a great all around preformer and it's angle of radiation is very useful. One of the best examples is the K-40 antenna. Hard to beat how well it works... you'll notice it was so popular that Wilson came out with a similar unit. I've compared them side by side, the K-40 works better.

If you want to read up and learn the truth, hop on Ebay and search for a copy of the ARRL Antenna Handbook. It's all right there in front of you.

cheers
skipp@pilot.ucdavis.edu

Source record: 50811

Crabtree listed a Clearwater, FL wireless number that is now a non-working number, he does not respond to e-mails from any of the 5 or 6 people he has ripped off.

If eBay can not get a hold of this guy, what good is Safe Harbor?

The purpose of this was to provide a "headsup". Not an invitation to flame. One of the parties is out $400.00, that should not happen to anyone.

Hmmmmm So does that mean that whether or not the antenna is top loaded, center or base loaded on a mobile antenna, it will not noticeably affect tx and dx? It's "longer is better" that is the most imporant thing?

And to add on more complication, all other things being equal, will the mag mount on the center of a sedan roof be noticeably better than a trunk mag mount antenna location.

Did it ever occur to you that Dave never comes out here because he can't defend his design ideas. He relies (maybe inadvertently) on idiots like you who have limited intelligence and are loyal no matter what... because they don't want to appear stupid. You coming to his defense is ridiculous at best. You know nothing about electronics and just make a total ass out of yourself every time you try your technical mumbo-jumbo. If Dave cared anything about the product he makes... instead of just taking all your money... he would be out here. You are indeed very gullible... Dave is fortunate to have such nitwits available!

And if I pissed you off... fine!
Maybe the smell of your own urine will wake you up...

To your first paragraph I would agree with both statements.

Now on the second paragraph... the location will make a noticable
difference. The center of the mass of metal (center of the roof) is always
the optimum place.

Professor you must have seen 2 counterfeits . I thought you knew the answer to your question, since you have seen many of them. While your at it why not look at one of his "real amps" the m80 is hardly an amp tp base your judgement on. It is a low end modulator/driver. Yes the answer to your question has been already answered in a previous post but all your attempts to try and say it is something other than what it really is you must have missed it ...

Professor, dave doesnt really care much about cb radio why should he waste his time on something he has no interest in. He has proven his amps have been basically superior to the rest of the keydown scene for many years, when he got reamed in the ass by the xforce gang that sort of did it for him. No longer would we see the innovative ideas which made his product and gave him the name he has today. Why should he? so some other slap dick can walk into his shop and leave making a living off daves ideas. No i don't think so .. If you actually think dave builds amps for a living you are wrong...The current line of davemade amps come out of the Carolinas. Last i looked he doesnt live there. But to nip your silly ass in the bud. He doesnt need to explain any of his ideas or designs to you. Perhaps he would come out here for you for a small consultants fee, How long would you like to talk to him? So again Who are you to question his amps? To me you are a pimple on his ass,The people who really know him have the utmost respect for him, as well as his peers. Thats why people come out here and will fight you till your bue in the face If you feel you can make an amp better than his go get the soldering iron hot we can compare it when your done, whether it is a AC mobile or base, Fet, Brodcast, better yet anything that has to do with electronics. but so far i only have seen a 1 pill and the old skywave come out of you and i am still not impressed. Any kit builder can do what you are doing the only thing you manufactured was the input and output transformer and its not real hard to wrap wire around a form for your transformer. Please lets end this thread You have nothing to else to offer.....

wrote:

*In article <39b3dc5c.16974814@news.gate.net>, jdaggett@gate.net wrote:
*
*> Algebraic addition is different from vector addition. Algebraic addition
*> is the addition of two scalar quantities. That is two numbers with
*> magnitude and no direcetion. Vector addition is the addition of two
*> vectors. Each having magnitude and direction. A SWR meter most likely is
*> not vectorially adding the current vector and a voltge vector.
*
*Well, call it what you want, but it sums the voltages and currents
*while maintaining the phase information; it isn't merely adding two
*magnitudes. In this respect, I'd have to call it a vector addition.
*
*> A dual directional coupler in fact measures the vector sum of the
*> inicident and reflected voltage vectors at the first port...
*
*This is either misleading or just plain wrong. The directional
*coupler measures the vector sum of the incident voltage, incident
*current, reflected voltage and reflected current. The reflected
*terms cancel out (since they are 180 degrees out of phase) and this
*leaves a value directly proportional to the forward voltage.
*
*The mere sum of the incident and reflected voltage vectors provides
*the net voltage at that point -- a measurement that provides
*little information for deducing at the SWR.
*
*> ...and at the second port measures the difference between incident
*> and reflected current vectors.
*
*Pretty much the sam story as above.
*
*> Each will develope a power across a known resistance. Thus at
*> the two measurement ports will yield a calibrated power that can be
*> used to measure SWR.
*
*How do you compute SWR from the net voltage and net current
*measurements alone? I see no way.
****

Consider this. In a dual directional coupler we have four ports. Port one is
connected to the source and port two to the load. Port A will be connected to
the voltage pickup circuit. This generally will be the primary of a RF
transformer. For this conversation sake it will be ten turns on the primary and

one turn on th esecondary. This will yield a voltage at port A about 20 less than that across the transmission line. Now port B is connected to a current pickup. That circuit is similar to the voltage circuit instead the 10:1 transformer is reverse. The single turm will produce a voltage at port B dependant on the current flowing at the transmission line.

Now at port A we have a voltage that is the sum of the incident and reflected waves. At port B we have a voltage that is repersentative of the current in the transmission line from the incident and reflected waves. Now how does this give us SWR? Simple if you know what SWR is. The relationship between the two voltages gives us a term called Return Loss. PortA and PortB must be terminated in the characteristic impedance of the transmission line. Thus the power at Port A become the reference power. The power at PortB will the measurement power. The difference between PortB and PortA, in dB, will be the return loss. Thus SWR is calculated by:

SWR = (10^(RL*.05) + 1)/(10^RL*.05)-1)

where RL is the Retrn Loss in dB.

SO when using a dual directional coupler to measure SWR the sensor at portA and portB should be well calibrated for power at the characteristic impedance of the transmission line used. The rectified RF voltage can be esily calibrated for power and esily used to measure SWR. The main work is the sensors and their calibration.

Oh by the way there is no polarity on the directional coupler. Port one can be connected to th eload and port two to the source. The functions of portA and Port B are reversed. If balanced properly, the measurements will be the same. james

The Landshark>>

Landshark, I must disagree. Where do you see that I posted an inflammatory remark such as you suggest? What I said was (and I'll paraphrase here) that he who wanted to set a newbie kid up in CB with a 6-pill (or whatever) amp was doing him (and likely his neighbors) a disservice by encouraging and equipping him to operate illegally. Now what is it that you wish to dispute: that a 6-pill amp is illegal? Of course you know it is. So how can telling the truth be "trolling" then?

Have you stopped to think of the consequences of giving the newbie kid an amp and then having him get busted by the local cops or the FCC? So chances are maybe one in a thousand, but hey, it could happen. And then would the "hero" who gave him the amp come forward and offer to pay the fine or share the blame? I seriously doubt it.

So lookit, Sharkie, a little discussion is a GOOD thing. Just open your mind a bit. Everytime someone criticizes the "outlaw life" on this NG it doesn't mean you have to jump on your hoss and ride to the rescue.

After all, this is rec.radio.cb, last time I checked. If you want a newsgroup where the charter prohibits criticism of outlaw CB - then start a newsgroup called "rec.radio.cb.outlaw".

And BTW, thankyou for refraining from using profanity in your response. It at least shows some maturity is in evidence here.

It depends on what the operator is looking for if it is an omni directional
pattern mounting in the center would be best, if they want to be slightly
direction there are other optimum spots
.

I believe that last time I put my MFJ259 on mine it checked good from about
26.800 to 28.004 mhz before starting to drop off of 50 ohms and wave going out
of bounds. SWR was centered at 27.205 at 1.1. Wilson 5000 drilled thru the
roof........

Not sure if you are familiar with birds watt meters if you look at a bird 50 ohm directional line section, you insert a element for a particular power range and freq into the port. You can turn the element either way, for a reading towards the source it would be of course reflected voltage and if turned towards the load will measure forward voltage of course. You can also get the dual element line section so you can read forward and reflect voltage at the same time, and either element can go in either port since the direction of the element determines what it reads forward or reflect but there are 2 circuits inside the element one for when it is reading the fwd and another pick up for reading reflect if 50 ohms is present the meter will null or have a reading of 0 so the element can be working fine on power but its reflect calibration can be off or vice versa ..

An efficient vertical radiator will have a 2:1 SWR bandwidth of something like 2.5%. You can widen it by folding the element or building it out of something like 6-inch tubing. If an antenna has better bandwidth than that you can depend some heating is going on. There isn't anything like a 52ohm carbon resistor for broad-band lo-swr.

There ain't no such thing as a free lunch; unless, of course, it is the Engineering staff eating popcorn.

Thanks for the feedback everyone.

From the responses, as well as from talking to a local sideband club, it seems that the consensus is to pick a number you like. I guess that makes sense since there is no regulartory (sp?) organization assigning unique numbers.

I'm only mobile at the moment, and did alright with the local club (that is until my truck battery lost juice - live and learn :^), but I'll be putting together a base antenna soon and setting up one of my mobiles inside. I'll have to play around with the antenna designs to see what works best.

Thanks again and 73's,
Cowboy

Some radios are rather obvious and are considered illegal from the get-go. What are commonly called "export" radios are pretty easy to ID; Rangers, Galaxies, Tristars, Connexes, certain Presidents etc. If a radio-savvy cop (I know 2 that are hams) spots one of these brand-names on the faceplate of your radio, he would probably have probable cause. Same thing goes if you have a big finned box sitting on your tranny hump that says "Texas Star" on the front of it. Have never heard of a cop actually enforcing FCC laws, and it might not even be within their jurisdiction, but it wouldn't surprise me if they did have the legal authority.

So.. having a radio in your possession that MAY be converted to out of channel
operations (See Copper for videos) is probable cause for confiscation of that
radio? Humm.. anyone see any parallels with certain black rifles?

So.. lets say, that your President Grant is sitting on channel 15, no mods
turned on.. and the savey cop flips the mod switch etc and then transmits off
band... is he guilty of a crime, or are you? Having the capability is not the
same as committing a crime..right? Any one want to open that can of worms?
(full auto sears/ parts in possetion notwithstanding..we know the misuse of
that system already).

Now.. if I have a footwarmer on the tranny, but the only feature running is
the recieve pre-amp.. and when I key..its only 4 watts RMS.. have I committed
a crime? (my ah..er..hum..footwarmer is not in plain sight...btw)

I have been a ham (ex-K8LJS) and have been around CB long enough to still
have my CB license on the wall at home (KOR5625)

Sounds to me like someone is wanting to open up a big can of worms with this
situation, once again....

Actually, yes, I think in the eyes of the FCC, you have. Just because they
dropped license requirements doesn't mean Part 95 has been pronounced null
and void. As I recall, according to Part 95, posession of a radio that has
been modified or is capable out of the box of being used outside the CB band
(or exceeds 4 watts) is a violation of FCC rules and can be confiscated and
the owner/operator fined. The same with the linear amp. You've got it,
it's hooked up to a CB radio, you're breaking the rules. Kinda like being
in posession of burglary tools, the police don't have to catch you actually
breaking in anywhere, just having them is enough. As to enforcement by
anybody besides the FCC, I don't know.

Snip:Having the capability is not the
same as committing a crime..right? Any one want to open that can of worms?

I read a FCC statute that if you just have in your possession a amplifier or
transmitter it shall be presumed it is for use.
If you are a jerk shouting "Hello Skipland" on 29.100 you deserve to be
busted but this post is not about Illegal operation in the amateur bands.
Radio operation is a privilege just like driving.....Not a right.
I know it sound like B.S but it sounds like enough to cause much of misery
with the legal system "ask anyone who's been accused of DWI" trying to prove
innocence or why you should have your Illegal stuff back.
"Mission accomplished for some square miserable bastard with nothing else to
do "
NOTE: I am 99 % positive I read it correctly, it was hard to find and almost
hidden.

No, but a little effort would probably show that he's part of a
"multi jurisdictional task force", easy enough to arrange, so
now each local jurisdiction essentially expands it powers of
probable cause ten fold and the revenue just flows in.

Burglar tools in the trunk? Execution on circumstantial evidence?
Paid informers? The lawyers have been working hard Gunner. There's
little that they can't use to make a case for most anything.

>

Of course not but that won't stop them from putting you in a cell
with an informer who will then swear that you told him that you
were planning to blow up some school.

>

Damn that does go back. Circa 1968 or something like that.

None of these relate to crimes anyway but regulations. And
if you are not a licensee of these regulators, then...?

I understand. Looks good to me. You aren't computing the SWR from the net voltage alone or the net current alone. You are using both measurements to determine the SWR.

4529. Re: TRC-449

a TRC 449 is a kick ass radio. Inside, it's the same as an ole 4 pin Grant,Adams, Madison Washington, or Cobra 138XLR.

Mod limiters are D23, TR18, TR19. I think the realistic has a resistor where D23 is (next to VR7). It also may or may not have TR18 and TR19.

CT7 is SSB power, VR8 is AM power. If you do any kind of tune up, you'll also want to replace C179 (a little blue capacitor between TP2 and TP4 near the final) with a .1 uf 16v (or higher) electrolytic or ceramic capacitor. That original tends to go bad and burn out the power regulator whenever the power or modulation is turned up.

From: gadget <gadget@jnlk.com>
Message-ID: <8p52hr$u8d$1@nnrp1.deja.com>
Source record: 51020

Oh, what the hell. Here's all the modification info I have on this rig to make it talk. I've owned 2 TRC 449's, A TRC 458, and a Robyn SB 510D and I did this mod to them all, plud a couple to radios that weren't mine. They all work fine, and I still own the Sb 510d.

The super swing modification for SSB radios using a Uniden board with the uPD858 Pll.

Including: Robyn SB-510D, SB-520D, President Washington, Madison, Grant (4 pin models only) Realistic TRC-449, 457, 458.

First, there are a few things that should be taken care of to keep your radio alive and happy. There is a cap in the filtering circuit for the final's voltage feed. It is either C179 (in my radio) or C175 (in the schematic). It is a small blue cap located in between TP4 and TP2 near the final. Replace it with a .1uf 16v (or higher voltage) electrolytic cap, or a .1uf ceramic cap. If using an electrolytic, pay special attention to the polarity. The tantalum cap you're replacing will be marked on it's + side, and most electrolytics are marked on the - side.

On the bottomn of the board (solder side) there may be another problem depending on the radio. Usually this problem is found on the Robyns, but may be in other sets. On the base of the final there wil be a 47 ohm resistor to ground. There may also be a pair of diodes in parallel (across) this resistor. If the diodes are there, remove them, but leave the resistor in place. DO NOT CUT THE RESISTOR OR THE RADIO WON'T WORK.

OK, now the easy stuff. AM limiters; cut out the following:D23, TR18, TR19. Some radios (mostly Realistic) have a resistor in D23's spot. Cut it. Also, not all radios have both TR18 and 19. Change R88 to a 100K ohm. Turn VR6 (if equipped) fully clockwise, and VR7 fully counter-clockwise. If you have a problem with a squeal, or there is just too much audio and the radio has no mic gain, back off VR6 untill the problem goes away.

Adjust CT7 for max power on SSB. For extra SSB power, cut D46. Be aware that cutting D46 makes the SSB audio SUPER LOUD. You'll have to cut the mic gain back pretty far to use SSB without distortion. I don't recomend cutting it unless the radio has a mic gain control. (actually, I don't reccomend cutting this at all. It sounds awful most of the time, but you will see some serious power on the meter)

After doing all of this stuff, whistle (or make some other such loud tone) into the mic on AM, and adjust L32 and L30 for max swing (on an RMS meter if at all possible). These are the two brown coils near the

finals that have adjustment slugs in them.

OK, now for the good stuff. I'll do my best to describe this procedure, but it's a little tricky. The actual operation is pretty simple. What you'll be doing is applying more voltage to the final. The modifications are in the carrier regulator circuit so the dead key will be something less than 15 watts or so.

STEP 1: disconnect the white wire that plugs onto TP2. Cut the plug off of it, and add another piece to extend it about 5 inches.

Step 2: Get the wire around to the other side of the board. Be creative, but it will need to end up near the carrier regulator, which is the transistor mounted to the case or heatsink near VR8. Solder this wire to the emitter of this transistor. If holding the radio solder side up, with the finals and the regulator away from you, it will be the connection on the left.

Step 3: Get a 100uf 16v capacitor. Solder the negative side of the cap to the center lead of the carrier regulator. Solder the other lead to the left lead (same one that the other wire is connected to). The wires may need to be extended so the cap may be placed on the other side of the board to clear the covers in a mobile unit.

Step 4: Remove TR 26. Short the left and center solder pads where the transistor was together. This will connect VR8 directly to the carrier regulator to let the dead key be lowered to a sane level. There still may not be lots of range to the adjustment. Mine will adjust from 0 to 2 watts dead key, but some other resistors have been changed in mine. If a lower dead key is desired, try increasing the value of R100.

Well, that's it. If you're succesful you should have a screaming radio now. Now hook it up and beat up on some "big" radios with it!!

There are no such channels as 29 to 59 - the numbering leapt from
1 to 28 straight to 60 onwards when the interleaved channels were added
in 1972.

The frequencies have private (marine based) uses in the UK.

4532. 148 GTL STNW Channel Mods

Newsgroup: rec.radio.cb
Date: 2000-09-06 10:54:33 UTC
From: Richard Camarata <rtcamarata@mediaone.net>
Message-ID: <Jnpt5.71744$_s1.852265@typhoon.ne.mediaone.net>
Source record: 51022

Has anyone had any luck with adding channels to this radio that actually are tuned in correctly? I installed the Expo kit and could not tune in the extra channels, then removed it (Do not get these kits!!! They add channels like 17.691 and are temperature sensitive due to the wire length from the board to the crystal/switches). If so is there a web site or detailed instructions on how to do this?

Thanks.

OK... so let me see if I got this right.
Dave doesn't care about CB or his product.
Dave doesn't want to be innovative because somebody might steal his idea.
Dave doesn't even have anything to do with the amp buiding any more.
Dave got whooped by X-Force.
Dave is such a good engineer, he feels that he has to discuss his designs
with no one.

Professor you seem like a man with more intelligence than this, most of the opinions that are posted are nothing more then that! "opinions" from people that are mostly speculating on the subject. For the application that they were designed Dave's amps. are no doubt superior to anything on the market today in the line of competition amplifiers. Anyone in the know understands that 123 work and gained his knowledge and experience with amplifiers through working for Dave. When he left he did nothing more than reproduce the same amplifier in another cabinet design, Even Ray Charles can see that. Just like your one pill that I have read about on the board, if it is any good someone will copy it and it will be on the market in no time in various forms and cabinets. Dave is one of the most informed and intelligent persons I have met in the electronics field since I have been involved with the CB radio and competition. It appears to me that you are knowledgeable in this industry and you seem to let the words of fools get the better of you and bring you down to their level of dealing with slandering someone that you have never known or talked to. I am not a tech and never care to be, but the simple design of an amplifier is easy to copy and that is what I see happen. As far as Dave, he is an innovator, and that doesn't require him being a CB nut. Mass production does not require expertise nor does it require hands on from the designer, only quality control. Dave has chosen to continue designing and completing a variety of different items that he has been working on for a while, as well a focusing on the AC class. This is something the average nitwit will find difficult to copy, and seems to me to be the wave of the future in the mobile competition. I don't like the posting wars, I think it lacks in a lot in a variety of areas. Feel free to e-mail me if you like (unlike most people I use a real address)

>OK... so let me see if I got this right.
>Dave doesn't care about CB or his product.
>Dave doesn't want to be innovative because somebody might steal his idea.
>Dave doesn't even have anything to do with the amp buiding any more.
>Dave got whooped by X-Force.
>Dave is such a good engineer, he feels that he has to discuss his designs
>with no one.

4538. Do some cars cause less interference than others ?

Newsgroup: rec.radio.cb
Date: 2000-09-06 13:42:09 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <xWrt5.591$YG5.2368@tor-nn1.netcom.ca>
Source record: 51028

Just wondering if some brands or models of cars are quieter than others, and cause less interference to CB/Ham radios etc. when running ?

I have heard that Fords are particularly bad, due to fuel pump noise. Is this true ?

Thanks,

Richard.

Yes Richard, they sure do. Also, it depends on where you get your power from and run your antenna wire. Some companys make filters to help with the problem. Just do some research, install the rig properly and then deal with the details when and if they present a problem. Good luck and God bless. Tennessee Bassman

> I have been a ham (ex-K8LJS) and have been around CB long enough to still
> have my CB license on the wall at home (KOR5625)

...As a matter of fact, yes... (you mentioned you're ex-K8LJS) According to
FCC regs, the mere possession by a non-ham of an 11 meter-capable amp is
illegal, whether in use or not. The argument that it's not in use will fall
on deaf ears. (wouldn't that kind'a be like saying, "..Sure officer, I've
got a pound of pot, but honest! I wasn't gonna smoke it or sell it!")

...As a licensed amateur, you can legally own an 11 meter-capable amp as per
FCC regs..... although, having it hooked up to a CB would indeed open a
whole new can of worms for you with the FCC were your station to be
inspected.

I understood the magnets 1000 and 5000 were the same only the coax was upgraded.
Yours is the first comment I have heard about magnet size having anything to do with performance. Care to elaborate?

The requirement for licensing was dropped from the regulations for Citizen's Band... FCC regulation was not. Marine VHF communications recently underwent somewhat the same process (license no longer required for pleasure boats under 60').

Higher is better, Longer is better, Long and High are the best.

Coiled antenna's will perform better when there are no obstructions around the coil.

Depending on where you mount the antenna you should consider the coil location.

Not everyone feels comfortable with a large diameter coil sticking out of their roof and looking like something from the Jetsons. The Wilson base coil units are a good compromise decent performance and unobtrusive appearance.

Since Dave doesn't care about CB he must be sending the profits for all his CB sales to charity. I DON'T THINK SO. I bet he is real interested in CB radio. I know I would be if I were him.

His product has stood the test of time good or bad it works and seems reliable. My biggest problem with all the manufacturers of CB equipment is their lack of participation anywhere. They all smile on the way to the bank but give little back in return.

You dont get 28-62 because they don't exist.

Suggest http://www.navcen.uscg.mil/marcomms.vhf.htm and you might also get some idea of what marine radio is for. You are fooling with public safety and people who do it for a living. Play rebel CBer and you might find a committee of your neighbors down at the marina visiting you with a funny-looking rope with a noose at the end.

I tried to inform Griffey about that. The last time I truly remember dave being excited about CB was when we were together in his old house and that was in the late 80's. Maybe around 1988. Dave has long soured on this CB stuff. And at best is just an overseerer of the amps!

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 45.00 INCLUDING shipping.
Great deal ! ! !!
A Picture can be e-mailed.

>

I saw a reply to my last post at home that I was planning on replying to
from work, but I don't see it here.

When I was referring to the "export" radios, I wasn't talking about
modded or modifiable radios, but certain types or brands that did just
not have type acceptance by the FCC and so had been declared illegal
based on the brand-name. Radios like Galaxies (I loved my Saturn),
Connexes, Rangers etc are not even legal to posess without a ham
license, and I've heard that they're outlawing them altogether as few
hams use them for their legal purpose. Comparing a modded/modifiable CB
(I think the Grant might be on the list of banned radios also) to an
export CB is sort of like the difference between an AR-15 and an M-60
for hunting. One may or may not be legal according to the mods done to
it, while the other is almost a sure bet to land you in jail, even if it
was just the deputy sheriff who caught you with it. BTW, if modifiable
was the criteria they used, then almost any radio on the market would be
illegal as they can all be modded in some way or another that would
render them capable of illegal transmissions.

In return for not requiring proof of radio theory knowledge or the morse
code (required by international treaty) by taking a licensing test, the
radios that are allowed in 11-meter band are strictly regulated (not

necessarily enforced) and certified to prevent interference or safety hazards. I am not endorsing or defending these laws (I got interested in ham radio through SSB on the high channels myself), just explaining my earlier statements about outlaw CBs.

I do think that anyone experimenting with modded CBs should at the very least take the time to educate themselves to the problems they might cause and the potential hazards involved, and understand that what they are doing is illegal. Once someone understands that, the consequences are based on their decisions.

I wonder if some of these truckers really think it is such a good idea to pump 800 watts into a mirror-mounted firestick a couple of feet from their head/eyes after showing their buddies how their little footwarmer will light up a lightbulb when they key down?

Only if there was a law in the US Code or a state law outlawing
possession of a ham radio by a non-licensed person. The comparison
isn't valid if no such law exists, since there is a law against
possession of pot.

(snip)

It's sort of like a person violating a part of the UCMJ while they
aren't in the military. The UCMJ only applies to military personnel.

Dear Gadget:

This is some pretty comprehensive information you've sent me here.
Thank you.
Just for the heck of it, I pulled the covers, and located most of the components.
All of them are still original.
I have found a switch on the rear panel, connecting to some places on the D858, where some cuts in the pc have been made. This was probably done to alter frequency?
What I would really like though, is diagrams, pics, and alignment (standard) procedures.
Thanks again.
Hans

The kid is getting some LMR 400 coax thanks to my friend,, and I just donated my old 4-pill amp i just had fixed a few months ago to this cause.... I wish I knew this kid sooner, and his Mom likes me too... Yup Yup....500 Bird Watts for the kid, I did my thing....
(Maybe in the future, I'll buy him a Mastodon 5000. from Santa... He has a spark in his eye like he's going to stick with it...)

73's Y'all....

Since the SWR protection circuit in my rig begins to cut power back when
it senses an SWR of 1.6 to 1.
I hate it when that happens.

I have a friend that drives Dodges. His Intrepid has NO automobile
generated noise. His RS 10m rig is so quiet, you have to look to see if
it's on.

Bill, I was looking through some old threads and came upon some comments you made about the RCI 2970. I was on the verge of purchasing one of the new RCI 2500DX or 6900F HP both export tuned up models from Express Electronics. You comments about the 2970 stopped me dead in my tracks, especially the following:

> The receiver is noisy and the
> noise rejection is basically non-existent

>he 2970 is full of compromises. The final amp stage
> is one of them. It is far from unconditionally stable.>>>>

Is the same true for the 2950DX or 6900F? I want the best and dont mind spending money for it as long I am getting what I pay for. (BTW, "the best" for me does not mean the biggest amp. It means a well designed, well built product that performs well in all areas of operation.)

TIA Nick

Several participants in this thread have their laws, rules and regulations, and levels of authority and jurisdiction mixed up.

CB - no individual or station license required, but technical regulations are still in force and apply to anyone within the FCC's area of jurisdiction (USA and territories).

This means that possession of an external RF power amplifier ("linear" - although that is only one kind of amplification and is the main type used for AM mode) that is designed or adjusted to work in the CB band is NOT PERMITTED FOR ANYONE in the above-mentioned areas. If you are a ham and have an 11-meter "footwarmer" and it is tuned to be maximally efficient in the 11-meter band, you are in violation. However, if your originally-11-meter amplifier is tuned to 10 meters or some other band, there is no apparent violation for a licensed ham operator. (The FCC might still ask for some form of certification or proof that the amplifier cannot be operated on 10 meters.)

FCC has authority to regulate radios and their use all over the United States and its possessions and territories. It doesn't matter if any individual is licensed or not; the regs apply to everyone. If you're unlicensed, transmitting is prohibited. If you're licensed, the other regulations regarding proper operation and technical specs apply to you.

Local police departments do not have jurisdiction to enforce FCC regulations. That is a Federal function, usually carried out by (depending on circumstances) the FCC itself, the FBI, and/or the United States Marshalls. A knowledgeable police officer may bring your unauthorized radio to the FCC or DOJ's attention, but he may not make an arrest or confiscate the equipment UNLESS there is a violation of some other statute that is within his power to enforce. If the officer knows that much about radio, she should also know all about the jurisdictional issues.

In the case of an 11 meter amplifier, a local officer could charge you with a relevant motor vehicle equipment violation if such regulation exists. If your radio transmissions are causing interference with audio or radio equipment belonging to someone else, you could be charged with some sort of "disturbing the peace" or "disorderly conduct" offense. Naturally, if you fail to cooperate fully with the officer to the extent required by law under the circumstances of your encounter, you can be charged with disorderly conduct or even some form of obstruction of justice regardless of jurisdiction on any radio issues.

So, in short, while the police do not have jurisdiction over your CB radio, it will not be productive to rub their noses in the fact.

Richard,

I am reluctant to criticize a particular brand of car, but I would have to say that in 30 years of installing, running CB and ham equipment, the Fords always seemed to have the most noise. I am not sure why that is, but it just SEEMS to have been that way. Usually, it can be cured, but in my experience, I had better luck with GM vehicles. Most of the time, I could put a radio in a Chevy and do very little extra noise hunting other than the usual and proper grounding. I will admit that this is one of the things that has caused me to own Chevrolets for 34 years, but that doesn't mean I have a particular beef with Fords. On the other hand, I had a '68 Impala that had a mysterious ignition noise. It took me quite a long time to find where the noise was generated. Turns out that the noise was being transmitted along the wiring harness to the tail lights where it, it turn, was radiated onto the antenna. I got some metal screen door wire, fashioned it to fit the light fixture, and screwed it on under the lens. This created a "grounded grid" that the noise couldn't escape and the noise was cured.

In recent years, I've heard a lot about Ford fuel pumps causing trouble necessitating bypass capacitors on the power leads. I think Ford has a TSO bulletin about this, and your dealer or electronics shop should be able to assist.

An amp is not a radio. It is illegal for non hams to posses an amp capable of being used on 11 meters and having one will lose you both the amp and your radio if you get caught. The radios he is talking about are also illegal in the US. Not because the may or may not be modified, but because they are not type accepted by the FCC for sale/use in the US.

Yes I can, nothing but the soldered tabs of the pills, the 10ohm resistors, and the drive side transformers and on the other side the soldered tabs of the pills, the 130pf micas and the output transformers. Now I know that you have seen the insides of one of these amps and I hope this puts things to rest.
Thanks, Peewee

Hamm4Fun,

Hmm--did you happen to see a blue Celebrity station wagon on the grass midway with a "huge" screwdriver antenna? I was down from the Shriners' concession on the first grass drive close to the guy selling tent/canopy covers on the concrete.

(BTW, "the best"
> for me does not mean the biggest amp. It means a well designed, well
built
> product that performs well in all areas of operation.)

I've had 5 2950's(actually 6 but one got stolen a week after I got it) through the years, to include one of express electronic's 2950hp that has been tuned with a channel guard installed etc. and just recently bought the new 2950dx and the one with channel guard was the best radio I ever owned out of all the other 2950's except for the new DX model which is even better. I've tried several radios and the 2950 is my favorite. just my opinion but I doubt you'd be disapointed with the 2950DX.

Another DaveMade proponent... great with opinions... terrible on design
facts.
We are trying to discuss the method of floating copper strips haphazardly on
top of a solid copper-clad PCB and why this method is not conducive to
repeating a stable and properly tuned RF product due to unpredictable
capacitances to ground being generated from this technique. It's very
important to keep the ground on a single "plane" for high frequency designs
for this exact reason. Major design priorities in HF RF layout include the
following:

1.) The use of feed-thru capacitors (whenever possible) and proper choking
on B+ lines.
2.) Use of large "ground planes" incorporating numerous via interconnects
from top to bottom planes in order to keep grounds "collected" and
impedances extremely low.
3.) Limiting the use of wiring connections between components to reduce
unwanted reactance's.
4.) Short leads on leaded components to reduce unwanted reactance's.
5.) Wide traces to avoid unwanted reactance's.

If Dave cared anything about his product he would be prioritizing these
important RF design layout guidelines...

4597. Re: unlock channel on marine radio

Newsgroup: rec.radio.cb
Date: 2000-09-07 00:43:53 UTC
From: Richard McCollum <rmccoll@radiks.net>
Message-ID: <evBt5.18793$3U2.852373@nntp3.onemain.com>
Source record: 51137

Point well taken and, yes, I did miss it. HOWEVER

1. Marine frequencies, for obvious reasons, are world-wide. We tend to use the low side of some duplex pairs as simplex freqs but the band is the same everywhere and the missing channel numbers are missing everywhere.

2. For a number of equally obvious reasons, there is not going to be a lot of difference between the USA and Canada -- the same ship in the Seaway could be going to Chicago, Duluth, or Thunder Bay and the ship in Halifax today could be in Baltimore in a day or two.

3. In the US, Canada, or Lower Slobovia the hobbyist user, not to mention the outright dink, is going to be about as popular as Dracula at a blood bank.

I just aquired a collection of tube amps from and older operator, including one called a "Footwarmer".. It has Pro/Comm 36KD6/40KD6 tubes (two of them). The 4 switches on the left side are rubbed clean of any markings..The leftmost switch is power, and the one farthest right is a HI/LOW switch (from what i can see of the wiring).. Anyone know what the other two are for ? Standby and preamp maybe?? Thanks for listening...747

Source record: 51122

I got a GE 3-5825b ssb cb radio. Someone did a mod to the clarifier. They removed the pot and installed a variable cap in its place to swing the crystal on receive and transmit. Its hard to keep on freq. I would like to restore the original pot for the clarifier. Does anyone have a schematic or anything?? It uses the PLL02a chip. There is a gnd wire, blue wire to a diode to the loop oscillator, a missing resistor to connect the blue wire to the circuit. I'm thinking I'm just missing a third wire for the V+ connection on the pot. Is it 12v or less (8v)?? any help...Thanks

4613. How do you like it...

They did what??? Replaced the pot with a trimmer cap? Are you sure?
If they did that... that means they have aborted the original varactor diode scheme. I can fully agree that a setup like that will be unstable with all the wires running all over the place. Are you sure that's what has been done?

Pot is illegal under nearly all circumstances, not so for linears, and as it has a dual purpose, that of recieve preamp..... your comparison is poor.

Now, the original thread indicated average everyday cops were using a CB/Ham etc antenna as probable cause to stop and search... the posession of which is a legal enterprise.. so they are using a legal antennna as probable cause to search for illegal items..see anything wrong with this picture? Not to mention curbside confistication of legal (unless the cop is qualified to pronounce said radio is illegal..and considering most dont know dick about radios...) there is a major problem here.

Although it's not illegal to make mods, etc. to a radio, it is illegal to use them (ex. a tech-class ham can have a HF radio as long as they don't transmit on it). But when your talking amps for 11 meters, that's different. 11meter amps aren't legal in anycase, so there's no reason to have one at all (making them illegal). But in the same token, if you modify a radio to transmit on a frequency that you won't possibly ever use, there's no reason to have it (making it illegal....)

From: Look@This.com
Message-ID: <39b801ee.15586084@news-server>
Source record: 51221

Anybody have any good tips on allowing these radios to retain their modulation levels when the dead key is reduced to around 2 watts. Also,Has anyone out here ever converted one of these to a high level modulation scheme(modulated in the final stage rather than back at the balanced modulator)using an AM modulator/regulator type circuit or something simular.If so,what kind of success did you have?
Thanks
Alan

That dude (SCSI UDMA) is more than likely the same person as cumsmoke. Hey Game, you want a real laugh? put together one of the 1 pills that professor provided a schematic for. Now that is funny. Be careful not to overdrive it, the transistor will not last long. For even more laughs look at it on a spec analyzer.

I can attest to one thing, he does not run anything Dave built. The amps he
runs in no way resemble a Davemade.

Now how would him using feed-through capacitors in his amps truly benefit
the design? they are built for keydowns and over-drive and over-volting.

OK. The term "dual directional coupler" threw me. There are not
two directional couplers (there isn't even one). However, it should
work as you describe by comparing the voltage and current terms.
For a matched condition, they will be the same. The difference
between the two readings represents the mismatch.

4639. FS: Palomar 350Z for parts

Sorry for the slow comeback but been away frome the NG for a while. If I read you corectly you are saying if I go down on the 10 meter band with an antenna tuned to 10 meters the radio as its now it will put out 30-35 watts. instead of the 10 watts on 11 meter? I know that if its not tuned to a certain band it would degrade its performance but never realized it would make that much difference. I also stated about the swing. I think its that cheap radio shack meter when I change the power range up to a higher setting the meters swings forward. But when I set it to a lower range it swings backwards. Weird I think. Thanks for the info. I will tune my antenna to 10 meters and do anouther power reading and see what happens when I get a chance to fiddle with it. P.S people do give me good comments on how well my radio sounds. and it seems to receive pretty good to. Except when a realy strong signal such as when the person I am listning to is right on my bumper. then it breaks up. but turning the RF gain back fixes that

Hmm. My battery lasts all night. You must need a new one. Didn't get chance
to talk with you. I'll be up on a mountaintop Friday and Saturday camping out.
See if you can make the trip after the skip dies out. That can be after 12 or
1 AM. I'll be making contacts all over, and will try to check 36LSB on the
half hour. We'll be over 1200' high right in PA near the Frederick/Carroll line.

Each one of the 8 2SC2879's can draw 20 amps at 14 volts.

Star's are not competition boxes. They are biased workhorses. If you
use normal voltage and reasonable drive, they last forever.

Yeah, having been pulled over a couple of times for that very reason, I do
see a problem. What I don't see is the funding to mount a major legal
challenge to the police practice of profiling possible drug courier or
escort vehicles based on the amount of visible radio antennas on the car.
This profiling is a fact, it has even been discussed on the TV news in Okla.
City as part of the multi-county drug task force. The ACLU isn't interested
in profiling unless it involves a racial minority. As for searching for
illegal items, it's a Catch-22 deal. An honest citizen wouldn't object (in
theory, and in their eyes) to a request to search, so if you object, they
detain you until a dog is brought to the scene. Even if you are clean,
you'd still loose that time waiting. While I'm a major supporter of local
and area law enforcement, I make an exception for the drug taskforce people.
They are too over-the-top regarding drug interdiction.

Yep thats what has been done...a small ceramic cap next to the crystal was removed and a shaft type cap mounted in the place of the pot. A wire from one side of the cap to the pcb at the place of the old ceramic cap and the other side to gnd as the ceramic was. I hate this but like the radio and need a schematic or something. When time prevails I will carefully look at the radio to restore it. I am very interested in viewing your schematic on the one pill. What is the address??? Thanks...LEN

4652. Re: WILSON 5000- "Love It"-or-"Hate It"?????

Newsgroup: rec.radio.cb
Date: 2000-09-07 09:43:21 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <39B76339.D6FC6BEF@island.net>
Source record: 51242

From the wilson web site:-
http://www.wilsonantenna.com/
The parts lists indicated that the
magnet are both the same for the 1000
and 5000 are the SAME.

For the rest...
Wilson "5000" Specifications
High Power Ability To
Handle 5,000 Watts
AM, 20,000 Watts SSB
(ICAS)
Made with high impact
Mobay Thermoplastic
6 gauge solid copper
silver-plated wire
Exclusive low loss
coil design
62" 17-7 PH Tapered
spring stainless steel
whip
Frequency range 26 MHz
to 30 MHz
Available in Roof Top,
Trunk Lip, or
Magnetic Mounts
2 year warranty

Wilson "1000" Specifications
Gain performance
proven by power gain tests at
Lockheed Corporation
Antenna Test Laboratory
3000 Watt power
handling capability (ICAS)
Made with high impact
Mobay Thermoplastic
10 gauge silver-plated
coil winding
Exclusive low loss
coil design (Patent
#4,882,591)
62" 17-7 PH Tapered
spring stainless steel whip
Frequency range 26 MHz

to 30 MHz
Weather Channel Ready
Available in Roof Top,
Trunk Lip, or Magnetic
Mounts
Color choices: Black
or White
2 year Warranty
.... and judge for you self.

I replaced my K40 with the Wilson 5000
and DID find a NOTICEABLE improvement
in TX and RX... but more noise on RX
though from power lines etc. in my
particular instillation. Instillation is
a permanent mount in center of roof on a
'92 Caviler Z24.

Cheers,
John

Hi
I'm looking for technical specification (programming interface, divide
ratio, no. of channels) of TC9111BP Toshiba PLL freq. synthesizer.
I found data on similar parts [TC910x] only, for example at:
http://members.tripod.com/~Malzev/cb-radio/
http://www.teleport.com/~tysonb/cbradio/cbradio.html.
Official Toshiba site contains no reference.

Thank you very much for any help.
Tom

Of course! Speed is dependent on how fast the wrecker is going tho.
All joking aside, I don't know about the V8 Dodges, but the V6s seem to
be quieter than anything I've seen.

Linears are illegal for CBers under all circumstances. If you want a
legal pre-amp, then use a pre-amp.

I would agree with you on that, and hope that you didn't think
otherwise. I'm curious if the ARRL has seen enough of a problem from
this to have said anything about it? I can guarantee that if the cops
started showing a pattern based on stopping people due to funny
antennas, the ARRL would make the NRA look like the PTA.

According to their CB-related regs, the FCC presumes that if you posess
a certain piece of equipment, you will use it, thereby making amps
illegal for CBers to own. Now where I get confused is with ham
equipment, as the same concepts do not seem to apply there. I wonder if
by some chance you were caught with an 11-meter amp (posession, not
use), would claiming that you were studying for your license make a
valid defense?

It's against FCC regs for non-amateur-licensed persons to possess an RF
amp.... period. Whether its 11 meter only or 160-10m makes no difference.

The Amateur regulations are completely different.... not much comparison
between the two services. Amateur regs were deliberately designed to
encourage experimentation and exploration of radio theory.

About 160 amps. Stock.

Then figure in about 30 amps for a driver if you use a 2 pill, 15 to 20 if you use a 1 pill.

You can see 2400 PEP watts out of it with 125 PEP watts of drive.

You WILL need a separate electric system to run it.

>

Hey Scott,

No offense intended about the SSB number. That's just my insecurity wanting to be sure I'm doing things right. I'll be using 260.

I'll give you a shout Friday or Saturday and we'll see if I'm walking tall enough.

About that battery, the problem is most likely related to my ignition switch accessory contact not working, so I need to put it on 'on'. That causes a greater drain. Unfortunately, I just wasn't thinking about

that the other night. I had to pull the plug, jump the truck and get back on (just in time to say good night.) I'll be setting up one of my rigs as a base soon, so hopefully it won't be a concern.

hrm... 500 watts from the get-go.. Wish I'd have been that lucky...

Of course, I had to learn the hard way how to make watts, and do it
clean, and not get caught...

I just hope you're not setting this kid up to get busted, and I hope
you'll teach him only to use as much power as he needs at the time,
and no more.

I wish you luck. I had occasion to try to get spec for their TC9122.
E-mails to every Toshiba office brought no response, not no useful
response, NO response. Eventually I phoned Toshiba in Japan and
requested data, I was told it was a discontinued device and no data
was available. This is for a product that is still being produced.
.. I for one will, in the future, never specify Toshiteba devices for
any application whatsoever.
Fortunately I was able to get the spec from other sources.

The radio should be connected directly to the battery.

I guess I'll be the first one to welcome you to the club next Tuesday. I get to run the net because 412 will be busy next week. So now I have to stake out a good high spot and maybe set up my camping antenna. I have run net out of the mobile before, but it would be nice to hear real good!

Visit Antenna Specialists Web Site and check out the
AS K-67 ground plane kit.

Ground Plane Kit
Model K-67 Ground plane kit for fiber glass-bodied vehicles.
Complete with instructions and sufficient adhesive
backed foil for one low-band/high-band or six UHF
ground planes (3 inches x 44 ft). Includes metal clips
for circuit continuity.

Click on the link below.

Read part 97 as to what constitutes a LEGAL amp. You will find certain features on CB amps that make them illegal, even for Amateurs.
So called CB amps, by virtue of design, have certain things that cause them to be considered contraband in the US, and therefore are illegal for ANYONE.
Now before anyone asks, "what things?" go read part 97. Lets see if anyone figures it out.

Yet I haven't seen where it is illegal to own ham equipment without a
license. Or did I simply miss something? I know i had my first 2-meter
rig the day after I passed my test. Is this one of those tecnhicalities
that they just don't worry about for new hams?

Gee.. they never said anything when I ran RTTY via computer on Chan 23 many
years ago...<G>

Of course, living in the desert, in a valley not noted for its skip or even
reception charectoristics did tend to be "out of sight, out of mind".
Which is why, there are a number of mobils who do run linears on occasion,
simply to be able to call for help or even simply communicate, because of the
terrain and poor reception. Since the CB craze died 10 or more years ago, the
yahoos are mostly gone, and CB is simply another tool, rather than a
lifestyle.. they have now gotten on the net... lol

Gunner

Here it is for those who have trouble finding it.

a) No more than 1 unit of 1 model of an external RF power amplifier
capable of operation below 144 MHz may be
constructed or modified during any calendar year by an amateur operator
for use at a station without a grant of certification.
No amplifier capable of operation below 144 MHz may be constructed or
modified by a non-amateur operator without a
grant of certification from the FCC.

(b) Any external RF power amplifier or external RF power amplifier kit
(see ï¿½2.815 of the FCC Rules), manufactured,
imported or modified for use in a station or attached at any station
must be certificated for use in the amateur service in
accordance with Subpart J of Part 2 of the FCC Rules. This requirement
does not apply if one or more of the following
conditions are met:

(1) The amplifier is not capable of operation on frequencies below
144 MHz. For the purpose of this part, an

amplifier will be deemed to be incapable of operation below 144 MHz if it is not capable of being easily modified to increase its amplification characteristics below 120 MHz and either:

(i) The mean output power of the amplifier decreases, as frequency decreases from 144 MHz, to a point where 0 dB or less gain is exhibited at 120 MHz; or

(ii) The amplifier is not capable of amplifying signals below 120 MHz even for brief periods without sustaining permanent damage to its amplification circuitry.

(2) The amplifier was manufactured before April 28, 1978, and has been issued a marketing waiver by the FCC, or the amplifier was purchased before April 28, 1978, by an amateur operator for use at that amateur operator's station.

(3) The amplifier was:

(i) Constructed by the licensee, not from an external RF power amplifier kit, for use at the licensee's station; or

(ii) Modified by the licensee for use at the licensee's station.

(4) The amplifier is sold by an amateur operator to another amateur operator or to a dealer.

(5) The amplifier is purchased in used condition by an equipment dealer from an amateur operator and the amplifier is further sold to another amateur operator for use at that operator's station.

(c) Any external RF power amplifier appearing in the Commission's database as certificated for use in the amateur service may be marketed for use in the amateur service.

I can't find any mention in the part 95 rules regarding CW, neither allowing nor disallowing it. Considering that it is simply an unmodulated DSB carrier, I doubt that they could or would say anything. By the same token, even MCW is still standard AM but with a modulating tone applied, so I don't see how they could rule it illegal considering that it allowed on every other band that I can find. I remember a statement in one of my old license books that said that it was the only mode allowed on all bands as it was truly universal. It didn't specifically say the amateur bands.

<< I just hope you're not setting this kid up to get busted, and I hope you'll teach him only to use as much power as he needs at the time, and no more. >>

I heard a kid on last night, an extremely loud signal that was splattering 8 channels or more. He was sing-songing the same phrase, "wavin a hand", over and over again - to no one in particular. I listened as he shut down a couple of truck drivers who were trying to keep in contact on a run. The kid made a game out of interfering with them.

But hey, the important thing was - he was enjoying his amp, right?

There's no way to do that because they use low-level
AM modulation. Below about 5 watts you start to lose
peak power. That's just the nature of the beast.

> Also,Has anyone out here ever converted one of these to a high level
> modulation scheme(modulated in the final stage rather than back at the
> balanced modulator)using an AM modulator/regulator type circuit or
> something simular.If so,what kind of success did you have?

It can be done, but I've never heard of it being done.
The common concensus is that if you're concerned with
having top AM transmitter performance, you steer clear
of radios that use low-level AM.

> specifically say the amateur bands.

CW is not mentioned in part 95 because it is not allowed. The allowed
modes for CB, per part 95 are, AM and SSB. Unless it's an emergency.

Illegal to use is not the same as illegal to own.

Given the relatively few good SW receivers on the market and their pricing,
many SWLs own transceivers because they're a better deal.

Why be an irritant? The CB guys don't want to hear Morse code.

We're only talking 5 WPM these days, you know. That's a bit less than 1 character every 2 seconds.

Set the computer program up for around 18 WPM with spacing for 5 WPM and have at it. spend about 15-20 minutes every day max. keep adding letters as you master the previous set. practice real words for learning, run some random groups to see how you're really doing.

don't forget to get time on numbers and punctuation (the stuff that stopped the last few guys coming through for the test -- there's at least 1 question about call signs.)

shouldn't take you more than a month to get to 5 WPM and you didn't have to get all stressed out or bored or tired or anything. and they'll be able to grade your test with solid copy instead of having to take the "exam" portion.

That is correct package bomb that injured the guys mother as well. I don't understand people sending hundreds of dollars through the mail to strangers with nothing in hand but a promise.

COD is the only way and that doesn't eliminate a box of rocks. Credit cards, in person or through a dealer as an intermediary who can also check the equipment.

It will cost more than box to go to court and people like this know it.

So the best bet now is take a trip with a your baseball bat and tin snips and say high to the person that wants to rip you off.

The way they get AM on these radios is to unbalance the modulator and moving the L.O. freq to the center of the filter. To change the carrier level you have to find the resistor that is switched in to unbalance the modulator. Increasing this resistor will decrease the carrier level. It does not effect peak output. I discovered this trying to put an HTX-100 on AM. Got the HTX to transmit AM OK, never could get it to rx AM that well so the project was abandonded. Once you figure out which resistor it is you could replace it with a pot. The resistor goes from a pin on the modulator chip to a transistor. Right now this is the best info I can give, hope it is enough.

Source record: 51066

Toll Free,
a "choke" refers to a specified operation of a coil in
a circuit.. However, whjen it comes to the design of
an antenna, a coil is not a "choke". It is a device for
making the antenna electrically longer (given the
actual physical dimensions of the antenna being far
smaller than a physical 1/4, 1/2 or 5/8 wave..

In some cases, the coil would have a continuous
taper (increasing windings per inch over the length
of the antenna). Such a system is employed by
Firestik antennas as a means of fitting a 5/8 wave
antenna into a form that is physically smaller.
Incidently, the Firestik antenna system also acts as
a voltage impeadance transformer (which can
generate extreme voltages near the antena's "tip".).
This voltage is what greats the EMF that is what radiates
energy off the antenna.

Toll Free wrote:

*
*OK. The term "dual directional coupler" threw me. There are not
*two directional couplers (there isn't even one). However, it should
*work as you describe by comparing the voltage and current terms.
*For a matched condition, they will be the same. The difference
*between the two readings represents the mismatch.
****

I built the exact circuit from RF Design article and that article called it a
dual directional coupler. IF it has another name so be it. The idea is to sample
voltage and current at the same point of the line and calculate SWR there. It
sure beats measureing voltage at two points on the line and then calculating
SWR.

Not with cars. All the way back to Carroll v. United States in 1925,
automobiles have been treated differently from homes and persons by the
Supreme Court. The so-called "Carroll Doctrine" has been expanded over the
years to the extent that a person in an automobile has no reasonable
expectation of privacy and very few Fourth Amendment rights, regardless of
whether they are the driver or a passenger.

Oh, heh.

This is just a perfect example of people not wanting to take
responsibility for their own thoughts and actions. Nothing new there.

Why do you think Welfare and Social Security were initiated in the
first place? Simple. People didn't want to be responsible for their
own lives, and certain government officials decided it would be a good
time to gain power over them by providing them with the income they
thought they deserved, even though they didn't have the forethought to
provide it themselves.

Don't get me wrong, I realize there are people out there who cannot
work for themselves. I'm not including them in that group. Of course,
the family unit would be stronger if their families would take the
resposibility for caring for their own family members, but, again, we
go back to the first sentance in this post.

Just my two cents.

Try 25 percent more
50 percent more, if you figure in driver, too

If you have the current to supply it, it will pull a lot more than you think

Thats the problem with bigger amps. People underpower them, then think they
are getting max out of them, call them pieces of shit, whatever...

When in actuality, it is the current source that is the problem.

I have said it before, and I say it again.

YOU NEED TO HAVE 20 AMPS PER TRANSISTOR, FOR WHATEVER AMP YOU ARE RUNNING
(based on the 2879).

For the 2290, figure 15 amps per transistor.

The MRF455 / SD1446 is about 12.5 amps per transistor.

Any coil of wire is a choke.

Its value of L depends on the diameter of the wire being used, spacing and number of turns... The former used also makes a difference.

The stinger still provides capacitance (which is why the "butterfly" shaped topped antennas work. They are nothing more than a capacitance hat.

The L provided in the coil/choke makes up for the lack of length in the shaft between the feedpoint and the coil. For a circuit to resonate, it needs the proper amount of L and C. An antenna is nothing more than a tuned circuit.

You need to take a look at the ARRL Antenna Book, and you will see what I stated was EXACTLY correct.

However, we are explaining the same thing. I prefer to look at things electrically, though.

> Toll Free,
> a "choke" refers to a specified operation of a coil in
> a circuit..

And an antenna is NOTHING more than a LC network.

Therefore, for it to be resonant, it needs a specific amount of L and C.

However, whjen it comes to the design of
> an antenna, a coil is not a "choke". It is a device for
> making the antenna electrically longer (given the
> actual physical dimensions of the antenna being far
> smaller than a physical 1/4, 1/2 or 5/8 wave..

A choke is a choke is a choke.

The purpose of the "choke" / coil is to provide inductance to a capacitive circuit.

Whenever any antenna is too short, it shows up as "capacitive". Use an antenna analyzer to see this, or a noise bridge.

To resonate a capacitor at a specific frequency, what do you add... L. What provides L...? An inductor. What is the common name for an inductor? A coil.

This is all just a question of semantics.

>
> In some cases, the coil would have a continuous
> taper (increasing windings per inch over the length
> of the antenna). Such a system is employed by
> Firestik antennas as a means of fitting a 5/8 wave
> antenna into a form that is physically smaller.

A. The measured L and C is distributed between the turns on the shaft (fiberglass).

B. The 5/8 wave of physical length is a sham. It is a continuously loaded antenna, and nothing more. A continuously loaded antenna is nothing more than a large inductor. The space between the turns of the inductor provide capacitance.

> Incidently, the Firestik antenna system also acts as
> a voltage impeadance transformer (which can
> generate extreme voltages near the antena's "tip".).

Any antenna (well, end fed) will have voltage maxima at or near the end
opposite the feedpoint (in common CB antennas here, guys).

The feedpoint will be voltage minima / current maxima. Elementary antenna
physics at work. it isn't a "transformer" in regards to the true sense of
the word.

> This voltage is what greats the EMF that is what radiates
> energy off the antenna.

The voltage isn't it. The antenna radiates because of the physical
properties. You can have an antenna that has low voltage, big current
(which, incidentally, is how the firestick works) and have it work well.

We are saying the same thing. However, I look at an antenna as an LC
circuit (which it is) that must be resonated.

That is how you must do it when trying to tune reactance out of it, and I
always tune for pure resistance / no reactance. Then, if need be, build a
transformer at the feedpoint to match that impedance to the characteristic
of the coax being used (normally 50 ohms).

This provides the MOST efficient transfer of power.

Well, it depends upon what frequency is being applied, for a given inductance
there are some frequencies where the coil does not act as a choke.

There are trade offs, as you move the coil higher up on the antenna it sees less of the capacitance of the antenna and the coil must have more inductance to keep resonance, which means more wire and more loss. There is point of diminishing return.

It is a choke only if at a given frequency the inductance is enough to have a very high impedance for that frequency. A coil may act as a choke at 27 mHz but lower frequencies may hardly see the inductance and pass right through. Not every coil looks like a choke to all frequencies. Take the tank coil that resonates the output of your 27 mHz transmitter and apply 60 Hz AC to it, the 60 Hz won't even see the inductance. So a coil is not always a choke.

4756. Just a theory?

Newsgroup: rec.radio.cb
Date: 2000-09-08 03:52:14 UTC
From: Tennessee Bassman <bassman@truckdrivermail.com>
Message-ID: <pangrscvjp9634bo1o4oatda0p7lbtgsb4@4ax.com>
Source record: 51092

Dear fellow cb lovers,

I have a theory, bear in mind it's just a theory. I call it the theory of social separation. You know it's funny how when people are face to face they are usually more civil toward each other. You put them in a car with a cb radio for instance, they get less inhibited and tend to say things they normally wouldn't. Without the radio and only sight to communicate with they act even more childish flipping each other off and such Immature behavior. Well then comes the advent of the internet, and maximum seperation is complete. I just joined this group the other day and I can't believe what I am reading.

Weren't these newsgroups created to communicate more efficiently and share information and ideas? You know, being the person with the most electronic knowledge or experience does not impress anyone much unless that information is given in the spirit of friendship and brotherhood. After all, aren't we citizen band operators kind'a of a brotherhood. Well, that's the way it used to be back in the 70's when I started anyway. What kind of example are we setting for the young ones who are getting into the hobby? Aren't they already subjected to enough negativity.

Now you can get on here and call me all kind of names and make fun of what I stand for but I say please, stand back for a second and think about what I am saying. I know we can't solve all the problems of the world by having some respect for ourselves and others but it's a start.

Your friend in Christ,
Tennessee Bassman

>>>No, that's not the point..

I wish someone would grow a brain and inform people who do stupid crap like that, that the CB radio is more than a communications device to a truck driver. It's a safety tool.

Kids who do stuff like that don't realize that road conditions ahead of a truck are of high concern to a driver, and if something sudden comes up that he COULD have been warned about, had he not been jammed by some idiot with nothing better to do, and that something involved a member of the kid's family, and that member of the kid's family died because that driver couldn't hear the warnings thru the hash and trash and bleedover, that the kid is at least partially responsible for what happens to his own family member.

Of course, this is just my two cents.

I'm not saying don't run power (the law has done that already), I'm saying if you're going to break the law and run power, then do it intelligently, and only use as much as is necessary to make the contact.

-SSB<<<<

I agree , I don't follow the ffc codes either , but at least I use wheats left of my head . May the FCC should crack down , if they started handing out 10,000 $ fines to some of the mega-mammoth radios in Chicago . They could double there budget in a few weeks .

power isn't what should be illegal (to correct my self) . The splatter should be . seting off fire alarms in buisness's when ya talk , making the nice old lady next door's toaster do the Texas two step across the counter . That should be illegal .

this is my two cents , and old green cents at that , now i wait for all the insults ..... go ahead toiletbowl people flush away ......

Nope.. you didn't miss anything... It is NOT illegal for a non-amateur to own amateur equipment, nor is an amateur license required to purchase amateur equipment.... with the exception of RF Power Amps. As the regs stipulate, you may purchase and possess (without benefit of an amateur license), but not operate same equipment except to receive.

No... It is not.

A 'choke" is defined by how it affects a tuned circuit
(or how it may permit or block AC signals in a specified
circuit).

For instance, when placed in series between the power supply
and the circuit, it effectively CHOKES off AC signals to the
DC power supply. in this arrangement, along with a capacitor
shunted to "ground" it behaves as a filter.

In the instance of part of a radiating system (such as an antenna),
it acts to electrically lengthen the antenna, or if designed as a matching
transformer (as such base mounted coil systems are) is designed to
provide an efficient match to the line. In both of these, it is not a "choke".

Now, would you like to cite the reference whenre your
statement is true in all cases?

for my cite, I used:
1. any year - ARRL Handbook
2. Floyd Electrnic devices (c) 1987-1999
3. the ARRL Antenna Handbook
4. the ARRL antenna compendium
5. the ARRL interference handbook
6. the ARRL antenna classics handbook

Message-ID: <8p9tmb$l1a$1@nnrp1.deja.com>
Source record: 51248

I have some type of interference from my truck engine. It is not real bad (the quitest I've ever had) but I would like to find the cause of the noise and stop it.I have to test this at night as the interference can not be detected over the "normal" day time line noise. The noise is only noticable when my antenna (firestick II) is mounted on the tool box. I'v ran an additional ground wire from he mount to the chassis but this did not help. If I remove the antenna from the mount the noise goes away so I know it is being "revieved" by the antenna not the mount or power wires (there on the battery.) If I move this same antenna to the rear bumber the noise is greatly reduced, almost to non-existent. I believe this to be due to the antenna being physically further from the source of the noise. I used an old antenna connected to the coax and definitely found the noise to be strong in the engine compartment. The nosie dose not seem to be related to the RPM's of the engine. Of course the noise goes away when I turn the truck off. i would like to use the tool box location over the bumber for obvious reasons. i would appreciate any input you may have. The nosie is bad enough to cover week signals.

682scmobile,
You didn't say what year, so I'm assuming it's a fairly late model. Your problem sounds like it ~may~ be the computer. One 'solution' to computer noise is to put torroids on the leads comming out of the computer. The snap-on torroids from the 'Rat Shack' are large enough to fit, some others aren't.
If that doesn't work, another thing to try is to get a 470mf 50volt ceramic capacitor, and connect it from each fuse in the fuse-box to ground. If your noise disapears, you'll know which accessory to 'look' at (by-pass it permanently).
If that doesn't work, get naked, paint your self blue, and dance around the truck singing "Tip Toe Through The Tulips". Won't cure the problem but it keeps the neighbors guessing.
'Doc

4765. Re: JOHN D BEGONIA RIPOFF UPDATE

Newsgroup: rec.radio.cb
Date: 2000-09-08 06:58:14 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8pa2nrise1@nntp9.atl.mindspring.net>
Source record: 51251

This is good advice..... However, believing this to be true I tried to get them to investigate a $490.00 rip-off, and gave them 3 other persons scammed by the same individual to contact. Weeks later I hadn't heard anything. I contacted them and was informed I had to fill out their fraud form. I downloaded it, faxed it in, forwarded it to the other individuals for them to do the same. I called to be sure the fax had arrived and was reviewed. Weeks later, it was assigned to an investigator local to the area the scammer lived in. After months of waiting, I finally received a copy of a letter that was sent to the address that the scammer was known NOT to reside at. He was also mail-tampering, having payment sent to another address. I had UPS use their city directory to call the folks at this address when I was investigating his claim of pick-up problems involving the box being sealed and having to be opened for inspection due to the declared value (which I had sent extra funds to be sure it was properly insured). The residents there had no knowledge of this scumbag or the transaction. It has 9 months now. Nothing has been done yet. The item was paid for with a USPS money order. I kept the receipt and had a trace done by the post office. There is a charge for this BTW. It took over 6 weeks for the trace to be completed. Not very efficient, seeing the priority mailed money order got there in 3 days.

The USPS Mail Fraud team is very good at publicity campaigns, but will bluntly tell you that they are too understaffed to look into individual claims. They are also not very honest in their interfacing with the public. On one call, I asked for the investigator and didn't have an extension. I was told that there were over 250 employees in that office. When I finally got in touch with him, I was told they were understaffed and there were only 3 investigators assigned to that area office. When I tried to reach his supervisor, I was passed off to an impostor which I finally managed to rattle enough for him to admit it.

I managed to contact a person local to the scammer to respond to another of his posts, and had him arrange a face to face meeting the following week in a public area local to the investigator's office. I gave the investigator this information, and he refused to monitor the meeting, although he had over 5 days to set up to catch this guy in the act. I was not the only complainant on this particular scammer. I provided addresses, phone numbers, pager numbers, aliases..... All this info I got from others he had scammed in the past 2 months.

Nothing was done, Still nothing has been done. If as much effort was placed into investigating the case on the info that I alone provided as was spent in making excuses, this guy would be off the street.

Remember, it is your paycheck that supports this type of lack of concern.
You pay their wages; they get a raise each year whether you do or not.

Doesn't that give you a warm fuzzy feeling all over??

This is one transaction out of hundreds made with pre-payment in the past 12 months. I estimate that I have done over $5K in purchases involving pre-payment and this is the only time I have been taken. I have seen people pay COD for empty boxes or ones filled with bricks for items weighing near the expected weight. It all involves the one bad apple out of a larger bunch of good ones. Having to pay extra for COD is not the solution. Having local, regional and national public servants do the task outlined in their job description may not be the entire answer, but it would be a step in the right direction.

-------clipped-------

If you find a "choke" in the center of an antenna, you only
have half an antenna. No signal would get passed it. Semantics
does make a difference. A choke is not found in an antenna, in
feedline, yes, antenna, no. A choke opposes changes in voltage.
If there is no voltage 'above' a choke in an antenna, there can
be no current either. No current, no signal. Semantics make a
big difference. You can call your cat a dog, but it still ain't
gonna bark.

I agree again... a "choke" is an inductor that has DC implications only.
The coil in the antenna sees no DC.

4776. Radio Mounting in a 1998 Mercury Sable - Any suggestions ?

Newsgroup: rec.radio.cb
Date: 2000-09-08 12:49:24 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <Vm5u5.2167$YG5.4630@tor-nn1.netcom.ca>
Source record: 51264

Does anybody have any suggestions for mounting a CB radio in a 1998 Mercury Sable ?

There is not much to attach the mounting bracket to under the centre of the dash, so I was considering perhaps a hump mount or anything else that somebody could suggest. The Sable has a flip out armrest which folds forward (towards the dash) that contains cup holders etc., so I would like to avoid interfering with the movement of that.

Any help would be appreciated.

Thanks,

Richard.

>valid defense?

1==> I certainly wouldn't think so, unless there was some provision
that allowed you to buy equipment in advance of being granted your
license on the condition that you didn't use it.

Would think this highly unlikely, as it would, in practice, allow
almost anyone to possess a linear amplifier. All the illegal user
would have to do is buy a license manual or study guide and there
would be no way of proving that he _wasn't_ studying for a license.

2==> However, if it was ever accepted as a defense, it would set an
interesting precedent. A high school kid with a submachine gun could
claim he was planning on a military career. Caught with prescription
drugs, he might claim that he was studying to be a pharmacist or
medical doctor. ;-)

3==> If you got caught with illegal apparatus and tried this as a
as a defense, your authorities would probably get a good laugh out of
it, though.:-)

I've done it already. They told me I couldn't use V-Belts on the four additional alternators I have on my suburban and they work great. The only problem I have is the belts stay on the pulleys all the time. I want to go to a serpentine system with removable drive belts. I've got all this big stuff in my mobile and most of the time I don't even need it because the little stuff can do the job. There's no reason to spin all those alternators. I'm interested in the crank pulleys and spacers.

>frequencies. (although... I don't think it's an approved mode for the 11
>meter band)
>
1==> Sorry, thought could lay my hands on my old CB license, but can't
find it at the moment. Am certain, though, that HF CB channels on 11
meters didn't [and don't] allow anything but AM or SSB voice
transmission. At one stage the issue came up when some farmers wanted
to use CB frequencies for telemetry applications, such as the remote
control of irrigation pumps.

Then too, if CB had been allowed, those chasing DX would have bought
Telereaders or communication computers so could use code on the CB
bands without the need to learn it. In DX apps, code would have
offered advantages as can get through where voice wont.

2==> On our UHF CB channels around 465 Mhz the service is restricted
to FM voice with the exception that can use tone modulation for
selective calling and repeater identification.

However, can't quote the regulation numbers to you at the moment. If
get time will look it up on Australian Communications Authority site
or at WIA [Wireless institute of Australia] site.
[Assume they will both have a site but don't know the URL's offhand.]

Dear Richard,

I don't know what the Sable looks like but I have a Nissan Frontier.
It is ALL dash ;-). So is my wife's CRV. I just use velcro and stick
them to the top of the dash. Easy to access and easy to see when
driving. I had a friend get killed in a head-on fooling with his box
under the dash. I don't concern myself with the way it looks since I
care more for my radios than the vehicles ;-) I don't really mind the
wires. I just take those and cable tie them down and under the mat
and under the seat. When I go somewhere where I am worried about
security I just pop it off and lay it in the floorboard and cover it
up. Really, that's my only option but it works pretty good.

Good luck and God bless,
Tennessee Bassman

Hi all on the list..
I am wanting to get in touch with Roger, who makes hte software but his e-mail address on teh site is not valid .....????
http://www.indirect.com/www/sxi/dti4home.htm is His site.

I am wondering if aynone cann tell me some things about DTI....

I have a superstar 3900 radio with mc145106 pll but it has 9 binary input bits, will DTI still operate this as it talks about only 8 and 10 ???

Another queation is how is it possible to give more that 8bit binary from the parallel port when there are only 8 data outputs ???, maybe this is a silly question but i was confused !!!

Does anyone have some technical docs for this interface ??

Otherwise, this seems to be a great way for me to go, as i want to add some extra channels to my radio ;-)

Thanks for reading ....

(Is it a Ford ??)

Could be the fuel pump. Mine makes a constant noise no matter what the engine speed.

Also, it could be reduced at night because you have your lights on. This seems to make a slight difference to my fuel pump noise, but I am not sure why. (Maybe the light cables are radiating the noise ??). Does the noise start only when the engine is running ? Try turning the key so that the ingition is on, but not starting the engine. If it is the pump, it should make the noise for a while (a second or so as the pump primes) and then stop.

Richard.

Some people don't know how much something is really worth. Many times auctions deliver inflated sale prices.

Miles, Go to a local machine shop and have him make what you need anything you get on the market will require some fabrication of some sort to get it to work on your system since every charging system is usually mounted differently. you can go to a auto parts store and get idler pulleys etc and have a machine shop make the pulley to go on the alternator then have it wleded or boltd on etc ... .

Excuse me?

If you have a problem with someone on my server, I suggest you email me about it first, moron.

What happened?

Give me specifics (in an email, NOT on the newsgroup) and I will see what I can find for you.

Otherwise (or, if you continue to make this a public bitch-fest), I have nothing for ya.

I keep it private until a conclusion is drawn to protect both parties. Half the time the guy bitching because he got screwed is the one that needs a good reaming. This keeps it civil. If I find the offender, they will be made public.

Next time, look around and find out what to do. This is the first problem I have heard about with something that happened on my server.

Thanks!

Then your amplifier is not a Class AB amp, is it?

Not biased into 180 degrees or more of conduction.

Or, it is just not producing the power where it should be.

Any of the above can be the case. What is your avg output at that power draw. I bet it ain't 800 watts. Or, your ammeter is broke bubba.

What I mean is that a choke is something used normally in a DC feed.
The "choking" action is only applicable to AC signals on that line.
The word choke has no meaning when talking about the makeup of an antenna...

A measure of inductance is not frequency dependant.

The XL of the inductor is. X is reactance, and when measuring inductance,
it is specified in +X.

When specifying reactance that is capacitive, you signify it as -L.

When +X and -X = 0, you have for the most part achieved resonance.

That would also be called a purely resistive load.

If it shows no wear at all , that is all the plating is still there, then most of them go for around $250 for the ones I have seen and this includes the few brand new ones that are offered from time to time coming out of storage. Last time I spoke to Astatic on the phone about this subject they said they have heard of some folks paying up to $1500 for a new never-used Golden Eagle.

For pix of my Diamond Eagle mic drop by my site.

Well, in all actuallity, that is illegal. But if you insist....the Yeasu 757 series are easily modified. There is a switch inside them marked GEN/HAM. Switch it to GEN and you have a radio that will transmit on every frequency that it can receive. I believe that is 80m - 10m. you might be able to find one used and in good condition from $500+.

Nonsense!
The "j" factor is the "unreal" (imaginary) part of any reactance whether
it's capacitive or inductive. It doesn't know if it's a plain old inductor,
transmission line, or an antenna!

> No... It is not.

Then every antenna company and electrical engineering book is wrong.

>
> A 'choke" is defined by how it affects a tuned circuit

And as I have said, an antenna is a tuned circuit. Thank you for specifying this.

If you don't believe an antenna is a tuned circuit, measure the feedpoint TRUE impedance for X and R.

> (or how it may permit or block AC signals in a specified
> circuit).

Right.

>
> For instance, when placed in series between the power supply
> and the circuit, it effectively CHOKES off AC signals to the
> DC power supply. in this arrangement, along with a capacitor
> shunted to "ground" it behaves as a filter.

No, not really.

Your thinking of a swinging choke, and the capacitor serves to resonate the swinging choke during the entire current draw.

Otherwise, you end up with crappy DC that still has the AC component on it. The swinging choke preserves the flywheel effect (just like the tank circuit of a tube amplifier), however, in this case, we are not resonating it to preserve the AC component, we are filling the void of the negative portion of the rectified DC.

>
> In the instance of part of a radiating system (such as an antenna),
> it acts to electrically lengthen the antenna, or if designed as a matching
> transformer (as such base mounted coil systems are) is designed to
> provide an efficient match to the line. In both of these, it is not a
"choke".

OK.. Right.

The matching coil is reffered to as a tapped inductor in EE circles:

(IE Radio Amateur Handbook, Twenty Third Edition, 22-6 'A Four Band Vertical Antenna'..... "A short vertical antenna can be used on several amateur bands by employing an adjustable base-loading INDUCTOR.'

Radio Amateurs Handbook, Twenty Third Edition 22-9, Fig 20. In reference to the antenna load L1 and L2 are referenced. L is the standard scientific notation for a measure of INDUCTANCE.

Radio Amateurs Handbook, Twenty Third Edition 22-15, Fig 30 -- Short Dipole for 80 or 40 Meter Operation: In reference to coils A and B. Coil = 9 mH. This is inserted into both elements of a dipole, in the center, for electrically shortening the length of the dipole for "top band" and "Near Top Band" operation. Again, it is noted that the coils are referred to as L.

ARRL Handbook, 1985 20.13, Figure 20.26 "The W8NX coaxial cable traps use two layered winding in series to provide an unusually high INDUCTANCE....." It should be noted that these traps are inserted into the radiators of the antenna. In essence, coils ... In other words, CHOKES.. A choke provides INDUCTANCE.

ARRL Handbook, 1985 20.46, Table 20.19 "Approximate Values for 8 foot mobile whip" Loading L in uH is called for the coil L1 (which is a the loading coil in a center loaded verticle ... eg most any center loaded CB antenna.)

I also refer you to ARRL Handbook, 1985 20.47, Figure 20.84 , and the accompanying text... "To find Lm (a center loading coil for a 75 meter mobile vertical) ... A mathematical formula is given, and I don't have the capabilities to show using simple text. However, the answer is given as 10 to the power of 3 uH. Then follows " The chart of FIG 20.85 shows the capacitive reactance of Cm and the INDUCTIVE REACTANCE of Lm necessary to match various cable .....". Keep in mind, Lm is a load in the center of the radiator. Farther into the text (page 20.48, first column, 4th paragraph, which is continued in the next column) "For manufactured loading coils that have no means for either adjusting or tapping into the INDUCTANCE, here is a simple L-Network matching method that requires no series inductor, and needs only a measurement of SWR to determine the value of the shunt matchine cap Cm. Bt extending the whip slightly beyond its natural resonant length (remember, I already spoke of this), the series INDUCTANCE orequired for the L network appears in the feed point impedance."

I really suggest you read the entire page, as it will show you that the coil is nothing more than an inductor inserted into the antenna radiator, and can be called a coil, L, inductor, whatever. Its primary function is to add inductance. The next series in the chapter covers the top loading capacitance (remember, what I said about the stinger).

I have other references, however, these where the only two that where available. The rest are still packed.

I guess if I have to, I can go find them, but that would REALLY be a pain in the ass.

Like I said, it is a question of semantics, but the proof is in the pudding. I have quoted my references, not just spouted off the books. I have proven the point, and that is that.

>
> Now, would you like to cite the reference whenre your
> statement is true in all cases?

See the industry standard references. William Orr is one of the most highly regarded engineers that has ever lived. The ARRL manual is considered to be one of the required texts for Electrical Engineers that thrive on, or are interested in, RF.

Have a good one, Eric. I suggest you open your eyes to something new, rather than be so damn closed minded.

A choke has no DC counterparts, other than pure resistance of the windings,
Brian.

That is simple.

To be classified as an inductor, it has to have an amount of positive
reactance (+x).

You saying that you can resonate a pure DC signal?

We are not talking about specific frequencies.

We are talking in generalization here.

What you are talking about is the amount of reactance.

ANY COIL OF WIRE WILL ACT AS A CHOKE TO ANY FREQUENCY. It is the amount of INDUCTIVE REACTANCE at that frequency that we are concerned with.

>
> It is a choke only if at a given frequency the inductance is enough to have a
> very high impedance for that frequency.

No, for it to totally block the flow of AC, it has to have a high amount of reactance at that frequency.

To resonate it, you need to cancel the reactance with negative reactance.. A cap.

A coil may act as a choke at 27 mHz but
> lower frequencies may hardly see the inductance and pass right through.

The key words here are MAY HARDLY.

Any coil of wire has inductance.

Inductance impedes the flow of AC, no matter how much it does, or doesn't is dependant on the amount of reactance AT THAT FREQUENCY.

Not
> every coil looks like a choke to all frequencies. Take the tank coil that
> resonates the output of your 27 mHz transmitter and apply 60 Hz AC to it, the 60
> Hz won't even see the inductance. So a coil is not always a choke.

So, you saying that if I put 100 of those chokes in series, it won't effect it, even though the distributed inductance is higher?

Seems to me the sum of all the chokes would act as one large inductor...

4834. Re: Lou Franklin's "Screwdriver Expert's Guide" book

Newsgroup: rec.radio.cb
Date: 2000-09-09 00:38:26 UTC
From: JR <jr@some.net>
Message-ID: <39B97765.FDE95061@some.net>
Source record: 51421

But depending upon the inductance and frequency it may not "choke" anything, the current may pass through it. A coil does not act as a choke at any frequency, only at the frequency such that the inductance presents a very high reactance. The word choke means to choke off the current flow. As I stated before, the inductance of the tank coil in your 27 MHz will have no choking effect of 60 Hz AC, it cannot act as a choke at that frequency. So a coil is not always a choke. Take a circuit of a coil and capacitor in series that resonate at 27 MHz. A series resonant circuit has a very low impedance at the resonant frequency, in other words it lets the signal pass, so in this case the coil is not choking the signal, if it were no signal would get through. Again a coil is not always a choke, it always has reactance to any frequency applied but it is not always a choke.

Thanks for the info. I am putting back in the same spot after having it tuned. 'course my damn Radio Shack CB decided it wasn't going to transmit anymore so I guess I have to get a new one of those too. I damn sure not going to ask opinions on which one to buy. Look at the crap that went down when asking what I thought was simple question. Thanks again.

No, Brian. You are speaking nonesense.

The J factor is what is explained when you are "laying out" the complex impedance... ie pure resistance, plus any reactance.

The measurement of X is the reactance in ohms (be it capacative or inductive) at any given frequency.

Both are exclusively different, but can mean the same (or damn near), when talking about complex impedance.

Put another way:

50-5j would mean 50 ohms, with 5 "ohms" of capacitive reactance. That would be complex impedance.

The straight reactance would be an X of -5, or Xc 5.

Obviously you have never dealt with antennas designed to operate on multiple bands.

A choke in an antenna can also be called a trap, depending on what the design is calling for.

What does an antenna radiate?

AC or DC.

If a choke is a coil of wire, and it has nothing to do with DC, then why is it an antenna that radiates AC that has a coil of wire in it can't be called a choke.

Let me put this to rest:

A multiband antenna.

2 meter / 440.

For 440 megaherts, the portion of the antenna below the coil is used. The coil is used to EFFECTIVELY choke off the 440 meg signal from the stinger.

The entire length, including the inductance of the choke / coil is used to radiate on 2 meters.

You need to bone up on your study of multi band and shortened vertical antennas.

Again... a trap is not a choke! These electronic terms are not
interchangable!
A trap is a tuned resonant circuit adjusted to a single frequency. It
however does have bandwidth.
A choke is not a tuned circuit but has a complex impedance associated with
it when working at a given frequency.

> But depending upon the inductance and frequency it may not "choke"
anything,

Right. But, that doesn't matter.

Or, to put it another way, just because Billy Clinton let some woman suck his dick, and he stuffed her vagina with a cigar, does that NOT constitute sexual relations?

The US Senate agreed.. However, I think that it IS sexual relations. So did the majority of the country.

the
> current may pass through it. A coil does not act as a choke at any
frequency,
> only at the frequency such that the inductance presents a very high
reactance.

Not totally true. For total choking of an AC signal, yes. However, any amount of inductance will present a choking action to any AC signal. It is simple physics here guys.

> The word choke means to choke off the current flow.

No, the word choke means to impede electron flow. No choke will be 100 percent effective in impeding current flow. Take for instance the plate inductor in a tube amp. You put a choke on it to keep the RF out of the power supply.

However, you also put a capacitor at the power supply end of the choke, to pass all energy that was let through the choke to ground.

Does this mean, since the choke was not 100 percent effective, that the choke isn't a choke?

As I stated before, the
> inductance of the tank coil in your 27 MHz will have no choking effect of
60 Hz
> AC, it cannot act as a choke at that frequency. So a coil is not always a
choke.

A coil is always a choke, at some frequency.

Whether or not it is 27 megaherts is another story.

You think that the coil of aluminum in my radio shack center loaded antenna doesn't choke off RF at 200 megaherts?

Yes or no.

> Take a circuit of a coil and capacitor in series that resonate at 27 MHz.
A
> series resonant circuit has a very low impedance at the resonant
frequency, in
> other words it lets the signal pass, so in this case the coil is not
choking the
> signal,

Because the capacitor is chosen as such as to cancel the choking action of the inductor.

If you take the cap out, or change value, it isn't cancelling the reactance presented by the inductor.

Too much capacitance, and the inductor will not cancel the reactance of the cap.

> if it were no signal would get through.

Again, not true. All chokes have leakage. All inductors have leakage.

Again a coil is not always a
> choke, it always has reactance to any frequency applied but it is not
always a
> choke.

So, you say that if I put my hands around your neck, and squeeze to the point of where I cut your oxygen intake by 80 percent, I am not choking off your air intake?

"Choking" is a function of an inductor.
It means that AC is literally choked from passing through it.
By your own admission... an antenna radiates AC.
If an antenna had a choke... you would radiate nothing!
An Antenna is a tuned circuit... a choke is not!
An antenna coil is not a choke... sorry.

No, a trap blocks the rest of the antenna from being seen by a certain frequency.

Look at it this way. A trap is a coil of wire, is it not?

I have a couple trap tuned multiband antennas for my amateur radio.

Their is no cap in them.

They depend on the capacitance of the cap hat and stinger to tune the circuit.

Now, listen closely.

Get a MFJ 259B.

Put it on a cheap Radio Shack mag mount or perm mount. Center loaded.

Sweep for resonance at 50 ohms across the entire band.

I bet you find more than one point of resonance, and I bet that damn "loading coil" will act just like a trap around 150 megaherts. (note, this frequency is totally dependant on the antenna used... The loading coil, size of wire and turns all make a diff here, as does the amount of shaft from the feedpoint to the choke / coil).

I bet it will.

Yes, and if you read the book you quoted to me to read, you will find that
the base loaded design is considered the most inefficient of any loaded
antenna.

Base loaded antennas with one
> stinger often emulate 3/4 or 5/8 wave antenna lenghts. Coils in the
> classic antenna are used for electrical shortening of the physical antenna

I was not, and still am not, talking about a shunt fed or base loaded
antenna.

>
> A lot of the actual radiation is off the stinger

All the actual useful radiation is off the stinger on a base loaded antenna.

You trying to tell me that the current concentration on an antenna is not at
the resonant load?

and the important thing
> you all overlook is the angle at which the signal leaves the antenna. Some

> antennas are better at ground wave and some are better at skywave.

Agreed.

>
> : This is due to the fact that the radiation is below the choke.
>
> It is not choke...

If you measure it in L, is it not an inductor?

Is an inductor not commonly called a choke?

What do you call the little wire thingy that feeds B+ to the tubes? A plate choke. What is it made of? A coil of wire.

>
> : The "stinger" serves little other purpose than to add capacitance to the L,
> : causing a tuned circuit.
>
> Wrong, a classic base loaded antenna has a metal stinger to simulate the
> physical top portion of the antenna.

So, when I make an antenna 3 feet tall, and then place a large coil on it, and only have a capacitance hat 3 inches above that, it isn't a tuned LC circuit?

This, believe it or not, is a damn good performing antenna. However, at around 40 thousand watts we blew one up in Memphis a couple years ago.

Put "sticks" on, and was able to tune to 70 thousand. However, reflected was somewhere in the neighborhood of a kilowatt and a half. With the butterfly antennas, it was negligible to 40 Kw. At 45Kw, when the antennas blew up, it slammed a 1Kw slug in the corner.

You adjust it's physical length to
> adjust it's electrical length.

So, when I put the 259B in line, and see inductive reactance, and tune the stinger, it isn't adding capacitance to negate the effect of the inductor inserted into the antenna?

Depending on the type of feed point, you
> might see a small capacitor at the feed point, but most often it's a

Skipp, where is the current concentration of a loaded vertical antenna?

At the coil, wherever that may be. Base, middle or top.

> For the most part, anytime you see a coil in a base loaded antenna, you
> can consider it part of a method to electricly shorten the antenna.

Nobody is arguing that.

There
> are some "trick" electrical lengths which get real close to the required
> 50 ohm feed point. These are the classic 5/8 and 3/4 wave versions.
> Often part of the function of a coil is to also transform the
> feed point impedance.

Yes, on a base loaded antenna.

The ARRL Antenna Handbook explains these handy
> electrical lengths where the coil does the job with ease. The current and
> voltage points on the antenna are shown in very nice diagrams.
>
> When you start moving the coil up toward the top of the antenna, it's

> classic tri band ham beam). Other uses as mentioned before are to
> physical shorten the antenna.

We are talking about monopoles. You are starting to talk about trapped
antennas.

>
> The 5/8 or 3/4 wave base loaded antenna is a great all around preformer
> and it's angle of radiation is very useful.

Yes, but it isn't a loaded antenna. It is an antenna that has a shunt or
gamma feed system. NOT what we are talking about.

The original discussion was why the continuously loaded firestick fiberglass
whip was such a good performer over the base loaded Wilson.

One of the best examples is
> the K-40 antenna. Hard to beat how well it works...

You obviously haven't tried one of the newer antennas.

American Antenna patented that antenna years ago. Read the original post,
some of the newer, larger coil, center loaded antennas blow it away... Both
for performance and power handling.

you'll notice it was
> so popular that Wilson came out with a similar unit. I've compared them
> side by side, the K-40 works better.

My mileage varied.

The K40 was about half S Unit lower.

The K40 burned up with a 667 as an amplifier (4X2879s). The Wilson took 2Kw PEP with ease. Driving down the road it was taking more. Sitting still, I ran about 2K into it. I figured the coil stood more of a chance to overheat while their was no forced air cooling

>
> If you want to read up and learn the truth, hop on Ebay and search for a
> copy of the ARRL Antenna Handbook. It's all right there in front of you.

I have every book the ARRL put out.

I still stand by my original statements, and if you read the other posts I have made, I have made quotes from ARRL handbook, as well as Billy Orrs book. I can go dig the other books out of the boxes they are packed in, but would rather not.

No, I meant choke. A trap is a tuned circuit used to 'block'
freuqncies higher than those the circuit is designed for. They
are completely different in design and purpose.

There ~is~ a capacitor in a trap circuit, it's a parallel tuned
circuit. You may not recognize the capacitor, but it's there. In
some cases, the capacitor is the 'can' surrounding the coil, and a
central core (the two plates).

Seems you have changed your idea of a choke. Here is the direct quote from one of your previous posts. "ANY COIL OF WIRE WILL ACT AS A CHOKE TO ANY FREQUENCY.

But then Toll Free wrote:

>
> A coil is always a choke, at some frequency.

Agree, but you said at any frequency.

>
>
> Whether or not it is 27 megaherts is another story.

So you are saying that a coil may or may not be a choke at 27 MHz. Depends upon the inductive reactance at 27 MHz.

>
>
> You think that the coil of aluminum in my radio shack center loaded antenna
> doesn't choke off RF at 200 megaherts?
>

>
> Yes or no.

I am sure it does, but what about 1 KHz? A 1 millihenry coil will have a reactance of 62,800 ohm at 10 MHz, at 100 Hz it will have a reactance of .628 (that's point 628) ohms, hardly a choke at that frequency. So a coil is not a choke at any frequency.

> It means that AC is literally choked from passing through it.

Right.

> By your own admission... an antenna radiates AC.

Right.

> If an antenna had a choke... you would radiate nothing!

Wrong.

If an antenna had a choke in the middle of it, the only portion that would radiate would be the portion under the choke, if the reactance of the choke was high enough.

If it wasn't high enough to prevent the AC component from completely passing through it, it would raise the resistance of the antenna (which is why inductance is signified by Positive integers).

> An Antenna is a tuned circuit... a choke is not!

A choke is half a tuned circuit, Brian.

> An antenna coil is not a choke... sorry.

Your very wrong.

But, have a nice day!

Toll Free,
A coil may be used in a number of different circuits, for
different purposes. Depending on it's use, it may be called
a coil, load, or choke. These names are NOT interchangable.
The name depends on what the coil is used for. The name implies
the use of the coil, and by using the incorrect name, you are
attributing incorrect properties to the coil. If a coil is
used to increas the electrical length of an antenna, it is
called a loading coil. If a coil is used in conjunction with
a capacitor, in an antenna, to 'cut off' a portion of the
antenna, then it is called a trap. A choke when speaking of
antannas, is usually though of as several coils of coaxial feed
line. It is used to stop alternating current flow on the outer
shield of the feed line.
Although coils are used in all of these applications, the
'name' of the coil is determined by it's application. Those
'names' are not interchangable. Semantics you know...

> of the rectified DC.

A swinging choke is designed to maintain a critical value of inductance over a range of current. As the current increases the inductance will decrease and as current decreases the inductance will increase (it has nothing to do with resonance). Very few power supplies use a swinging choke, these are use where some regulation of the DC over a current range is desired. Of all my ham gear and some 150 vintage radios, none use a swinging choke and the DC is just fine.

Yes, and no.

DO YOU HONESTLY BELIEVE THAT ANY "CHOKE" HAS AN INFINITE AMOUNT OF
RESISTANCE TO AC ELECTRIC FLOW (reactance).

Do you believe that if I conly cut off half the air going down your
windpipe, I am not "really" choking you?

>

And 6 tenths of an ohm of reactance is the same as no reactance, right?

As I said, it is a question of semantics.

You people enjoy the argument.

Give it a rest. I have quoted de facto standards within the industry where it was referred to as a choke (remember, a choke is nothing more than an inductor. A choke is a coil of wire with a measured L. Understand?).

We can both be right, you know.

So, now you are reiterating what I said earlier.

A trap is not necessarily a "tuned circuit", consisting of parallel LC.

It can also be series LC, which the capacitance added by the stinger, as well as the space in between the turns of the choke inserts.

Simple physics.. Still.

The laws of physics apply to CBers, as well as the rest of the world.

So, a choke and a trap aren't the same thing?

Or better yet, a choke isn't used to "block" frequencies higher than those the choke is designed for?

I can quote you where you said it WAS, just a few posts ago.

So here we have it. Doc, is amazing. He can alter the laws of physics to suit his own argument.

Typical Texas ham.

As far as the coil it is as that 6 tenths of an ohm reactance will be less than the resistance of the wire in the coil, so it certainly can be completely ignored and the current limiting factor will be the wire resistance, not the reactance. So the coil could not be considered a choke at that frequency.

Honestly, where the hell do you live?? Of all the areas of the US I have been in, and Canada, I have never heard of an area filled with Kids running KW boxes (and I would know if they were in my area, I know most of the kids that have CBs in my area. Yes I know myself pretty well.....), unlicensed 10 meter ops fooling around and all the other stuff you say happens regularly on the air where you live. Sorry, I find this a bit hard to believe. Either the DC/Northern VA area must be pretty tame CB wise, I have not been to bad CB areas of the country (not counting channel 19), or.................

Well any coil, even a filter choke will have a resonant frequency. The stray capacitance in the windings will resonate it to some frequency.

Or it could be using the stray capacitance of the windings.

About 4 1/2 years for me.

I started when it was in Beta, for NT 5.0

I still got the original MS beta CD for it. A burned one with a paper label
:)

Been on WinME for about a year now, as well.

WinME is awesome, too.

>Very few power supplies use a swinging choke,

That should read very few MODERN DAY power supplies use a swinging choke.

Henry power is about the last company (for amateur use) I know of that does.

BTW, you hear about Alpha? They are closing their doors when the current production runs end.

Sad, but true.

these are use where
> some regulation of the DC over a current range is desired.

They also supply more current than when using a capacitive input.

However, the capacitive input filter is a hell of a lot more stable, as far as output voltage goes, with wildly varying loads. Therefore, the capacitive input filter is used in SSB and low current, whereas the choke input is better suited for AM and FM use, where a semi-constant load is given.

Of all my ham gear
> and some 150 vintage radios, none use a swinging choke and the DC is just fine.

Hrm.

I have some that does.

> Toll Free,
> A coil may be used in a number of different circuits, for
> different purposes.

Agreed.

Depending on it's use, it may be called
> a coil, load, or choke. These names are NOT interchangable.

Uhh... Depends on whom you ask.

> The name depends on what the coil is used for. The name implies
> the use of the coil, and by using the incorrect name, you are
> attributing incorrect properties to the coil.

You think that the coil in an antenna doesn't concentrate the current lobe
at or below the coil?

Yes or no?

If a coil is
> used to increas the electrical length of an antenna, it is
> called a loading coil. If a coil is used in conjunction with
> a capacitor, in an antenna, to 'cut off' a portion of the
> antenna, then it is called a trap.

Or, if it is inserted anywhere in the antenna, it can also be referred to as
a choke, since the capacitive element of the stinger (or "the rest of the
antenna') will supply the needed capacitance to resonate said
choke/coil/inductor at another frequency.

Yes, or no?

I have trapped yagis that have NO capacitor in them. Are they not
multiband? Does the coil not act as a choke?

Would a magnet mount dual band antenna not use the inductor inserted midway
up the stinger as a choke?

DOES THE POINT OF MAX CURRENT IN THE ANTENNA NOT CONCENTRATE ITSELF AT THE
POINT OF THE CHOKE/COIL/INDUCTOR?

A choke when speaking of
> antannas, is usually though of as several coils of coaxial feed
> line.

I prefer ferrite on the feedline, or using another piece of coax.

Using another piece of coax, it is actually possible to extend the BW of the antenna, since the capacitive reactance of the coax tends to negate the inductive reactance as the frequency of operation is changed.

It is used to stop alternating current flow on the outer
> shield of the feed line.

Agreed... In the point you are trying to make.

And a grounded base / grounded emitter amplifier is NOT class C, right?

You going to tell me that DC grounding the base of a transistorized amplifier (via a 'choke') will provide the same linearity as biasing the transistor on now, right?

Hell, it is conducting over NEARLY 180 degrees of the drive signal.

Sorry, that BS I don't buy into, either.

I know what your point is, but your arguing to the wrong person.

I have cited examples in this discussion, from reputable sources, and I will not waver.

You call it what you want. I call it what I want.

This is a waste of bw, and I will not be following up with it anylonger.

Keeps BSing people into thinking that a coil of wire can be thought of as 3 different, SEPERATE entities.

lol

Finally! Someone else got it.

Most chokes used as traps DON'T use any external capacitance in the antennas
I have.

Doing so only increases cost, complexity, parts count, and lowers the power
handling capabilities of the antenna.

The last reason really comes into play when I fire up the 4CX5000

2K

It has problems with ASPI compliant devices (read that as SCSI). Adaptec has universal drivers to resolve this problem... And has since the beginning of the year.

It doesn't like IDE devices... Small wonder. IDE is for home PCs. Disk drives and CD roms work fine, but things like massive floppy drives and CD burners IDE are crap with Win2K.

WinME? Well, their is no "native DOS mode"... Meaning, keep your Win98 boot disk.

I have a patch to enable 16 bit dos mode, but it has drawbacks as well.

WinME is the first move towards a true 32 bit 9X platform.

Sure, their are compatibility issues resulting from that, but hey... My WINME has over 2 weeks of "on" time, and the last time I rebooted it was because I installed a new program :)

The truck is a Toyota T100. It makes the noise only when the engine is running. The noise is present with the lights on or off. It is reduced by using the rear bumper for mounting the antenna instead of a more foward position like on top of the cab or tool box. I don't believe it's the pump b/c the tank is as close to the bumber as anywhere. I placed two 470 micro farad caps accross the EFI computer and ground with no success. If plug wires were the problem shouldn't I see the noise frequency change with RPM?

Win 2000 was written for the corporate network envirnoment, not for the home or a single workstation. There are no advantages to using it on the average home computer, only disadvantages. The absence of plug and play is one example. If ME is stable, its probably a good bet for the home user. Unfortunately the first release of any new program or operating system from MS has in the past always been real buggy. For me, I am staying with Win 98 release 2 becasue its got all the bugs worked out, is real stable and does everything I want.

>What are the drawbacks to 2000 I have heard drivers for scanners etc are not

Sorry Doc wrong again... never seen a parallel trap. That's called a tank!
A trap is a series resonant circuit consisting of an inductor and capacitor
in series. Most CBs have a trap right at the output. It's tuned to 52MHZ.
This is a problem sonetimes as "golden screwdrivers" spread this coil in an
effort to adjust the output power and radically change the trap frequency.
After they see it didn't change the output power... they just leave it. This
can cause big changes in interference on the VHF television band...

Really I'm quite surprised at Toll on this one...
I think the main point he's missing is that a choke is an "application" for
an inductor. Inductors have several applications and the terms for each in
any given design are not interchangable.

> Win 2000 was written for the corporate network envirnoment, not for the
home or
> a single workstation.

Wrong. Win2k professional was written to be used on a single workstation,
as a lone server (if you don't need domain model / active directory
security) or as a web server. It will do all of the above.

There are no advantages to using it on the average home
> computer, only disadvantages.

I guess the stability that comes with NT is a disadvantage to you? I have
some 2K server, still on beta rls's of 2k, that are running with uptimes
approaching a year. Thats a disadvantage.

>The absence of plug and play is one example.

What?

The NT kernal has had plug and play since service pack 3 on Windows NT 4.0.

Your nuts. Go learn your microsoft products.

Windows 2000 has the best plug and play model yet.. Clearly better than
that Win98 / NT 4.0 EVER had.

If
> ME is stable, its probably a good bet for the home user. Unfortunately
the
> first release of any new program or operating system from MS has in the
past
> always been real buggy.

Not totally true. You seem to fall victim to the media hype that surrounds
everything Microsoft.

Yes, it was reported that Win2K had "tens of thousands" of bugs.

You ever see that list? MOST where "enhancements", like one user saying he
didn't want the sliding menus.

Yep, sliding menus are a real bug, huh? Their was no other area to put them
on the beta reports, so they where filed as bugs. Since some where able to
be turned off (like the sliding, animated windows), Microsoft chose to
ignore them, however, they where still filed.1

For me, I am staying with Win 98 release 2 becasue its
> got all the bugs worked out, is real stable and does everything I want.

You stay with that OS.

The rest of the world can upgrade to ME, and have a better, mo stable, mo reliable OS.

Sorry bud. Your post looks like media hype, and is TRULY not written by someone with experience with the operating systems in question.

I understand the point completely Brian.

However, what you guys are failing to understand is that in an antenna, a choke can be either the loading coil, or it can also serve dual purpose as a trap.

Simple physics.

I disagree here.
according to the books I have here, the "j" factor (
also known as the "i" factor) IS the imaginary component
in an impeadance measurement or calculation (specifically with
SMITH CHARTS). It can also be referred to as a
"vector component" of the calculations.

Thus, I firect your attention to Chapter 28 of the ARRL Antenna
Handbook (16th Edition).

A fiarly complete discussion of what the "j" factor is and how it is used
takes place upon these pages.

I shall also refer you to the following texts:
1. W.N. Caron, "Antenna Impeadance Matching" (Newington: ARRL, 1989)
2. P.H. Smith, "Electrnic Applications of the Smith Chart", Reprint ed.
(Malabar, Fl: krieger Pub Co, Inc., 1983).

Eric,

You need to do a bit more studying, in order to really know and understand what you are reading.

So far, you have made some good posts, but your interpretation of the material is a bit lacking:

> I disagree here.
> according to the books I have here, the "j" factor (
> also known as the "i" factor) IS the imaginary component

You think that reactance is imaginary? A chokes inductance, or a capacitor REALLY doesn't have any opposition to electron movement in an AC signal?

> in an impeadance measurement or calculation (specifically with
> SMITH CHARTS).

Yes, this statement (only above) is true. It is NOT, however, imaginary.

This is part of the "complex impedance" that I have been trying to get people on this newsgroup to see for over a year.

An antenna is not purely resistive when it is not being used at its resonant point. Once you stray from the exact frequency that you are resonated to, it will indroduce reactance (opposition) either capacitively or inductively.

It can also be referred to as a
> "vector component" of the calculations.
>
> Thus, I firect your attention to Chapter 28 of the ARRL Antenna
> Handbook (16th Edition).
>
> A fiarly complete discussion of what the "j" factor is and how it is used

Please, PLEASE, do a little more studying, and hone your comprehension skills. The J factor (measurement of reactance) is NOT imaginary. The Smith Chart you refer people to above proves this.

And stop just giving names of the books. I don't feel like going and reading a 600 page book to find the one paragraph that you are referring to. Give page numbers, etc...

Thank you.

2K is great, but if you don't need the advanced networking, and are a basic home user (read this as reboot your machine on a regular basis), nor if you need the advanced security of the DS, then ME is just fine

I paid a dollar more for my Kenwood TS440SAT.

It has voice synthesis, built in antenna tuner, a pair of 2879s for output devices and covers from 160 meters to 10 meters continuous TX, and 10 khz to 30 megz RX.

I am very happy with it. Was it new, no, but a better radio by far.

I do?
Funny,
I've been building antenna for years here, have a
"mostly complete" education from DeVry and Glendale
Community college in electronics engineering
(it was one of my minors).

I have 30 boxes full of texts dealing with the subjects of
electronics (in general) and a minimum of 22 Textbooks
on the various aspects of antenna design, impedance
matching and other related items (in particular).

I have these in braille and talking book (as well as stored at
text files for use via my speech synthesized computer system).

I have done far more reading on this subject than I care to.
I have created antennas from the designs found in the
ARRL antenna Handbook, the various issues of the
Radio Amateur handbooks (from various years) and have even
gotten assistance from a few of the local "elmers" in cases where
I became "stuck" with a problem.

I use programs to model my calculations to real world antenna
systems (such as mathcad and others).

Your statement is tantamount to calling me illiterate.
Are you doing so?

Now you have had several folks in here disagree with you
on the various aspects of antenna design, you have used
a generalization out of context more times than I'd rather count,
and you refuse to accept anyone else's opinions (even to the
point of stating that you are right and all the textbooks are wrong).

I won't claim to know everything about electronic circuits or antennas
but I do have sufficient field experience to know what the hell it is I
am talking about.

Prof, as you so nicely pointed out, there are several uses for inductors that are not interchangeable. Similarly, either a series or parallel resonant circuit can be used in selective applications which again are not interchangeable.

A tank is parallel resonant at a desired freq to prevent shorting the rf to the power supply. Let us not get into broad-banded filters for the moment. The trap you describe is a series resonant circuit designed to short-circuit the second harmonic to ground without disturbing things at desired freqs. Mixing the two is not uncommon.

A trap in an antenna is a parallel resonant circuit designed to present a very high impedence to a band of frequencies. The classic is the 10-15-20 triband dipole. At about 8ft (10 meter quarter wave) a trap tuned to about 29 is inserted to isolate the rest of the antenna when operating 10 meters. On 15 the trap acts as a loading coil so that it takes very little extra length to resonate at 21 MHz where another trap is inserted tuned to about 21 and a bit more wire brings it into 20 meters 14 MHz. Mosely many years ago did it with one trap.

There may or may not be a discrete capacitor. There is a design in the Handbook which uses two coils in series and winds them one above the other using capacitance between the windings to resonate the trap. The inductance at 3.8 MHz using a 40 meter trap is high enough to only require 87 feet

rather than the usual 120 or so. But it is still a parallel resonant trap.

This whole discussion is getting far too theological.

Dick

A choke has choking ability from a selected frequency and the choking action increases as the frequency increases because it's not a tuned circuit.

A trap however only "traps" within a certain band... reducing trapping action at frequencies higher and lower because it's a tuned circuit.

While any inductor can be a choke or part of a trap... that is not the
function in an antenna... period!

My vintage radios go back to the 1920's and up to the 1940's, some of my ham gear goes back to the 1950's, I have rebuilt a number of amplifiers for 1930 and 1940's juke boxes, and none used a swinging choke, so it does not apply just to MODERN DAY power supplies.

That would be Electrical Engineering.

Been their, done that, then decided that Computer Networking was more down my lines.

>
> I have 30 boxes full of texts dealing with the subjects of
> electronics (in general)

And if you don't understand or comprehend what is being talked about, a thousand books wouldn't help.

and a minimum of 22 Textbooks
> on the various aspects of antenna design, impedance
> matching and other related items (in particular).

I find it amazing that someone so well learned would believe that reactance doesn't exist.

And uses the Smith Chart to support his claim!

>
> I have these in braille and talking book (as well as stored at
> text files for use via my speech synthesized computer system).

To quote Rich Measures...

zzzzzzzz

>
> I have done far more reading on this subject than I care to.
> I have created antennas from the designs found in the
> ARRL antenna Handbook, the various issues of the
> Radio Amateur handbooks

I used the same, but never used exactly what they where doing except in the very beginning.

I learned that to be competitive on the 11 meter band, the general designs found in the texts wasn't what was needed

Optimization is what we needed, and now most of my monobanders exhibit FAR more gain than what was published.

Of course, I could care less about F/B ratio on these antennas.

(from various years) and have even
> gotten assistance from a few of the local "elmers" in cases where
> I became "stuck" with a problem.
>

> systems (such as mathcad and others).

Mathcad is good, but why not step up to the government standard NEC?

>
> Your statement is tantamount to calling me illiterate.
> Are you doing so?

No.

Illiterate and not comprehending what you are reading are two different things.

If you have a complex about being illiterate, I feel sorry for you.

However, I did NOT call you illiterate, and don't believe that you are.

I think you need to squeeze in a reading comprehension class.

>
> Now you have had several folks in here disagree with you
> on the various aspects of antenna design,

No, I have had several folks in here not understand that a loading coil in an antenna can also be referred to as a choke, simply because that isn't what they where taught to parrot.

I stand by my point.

By a damn MFJ or AEA antenna analyzer, and sweep from the bottom to the top of the spectrum it covers.

You will find that the "loading coil" will act as a "choke" at other frequencies, and that the antenna that is a loaded antenna at one frequency, because of the choke action of the coil of wire, at another frequency will also be resonant.

Case closed.

you have used
> a generalization out of context more times than I'd rather count,

No, I have specifically quoted text.

So far, you have done nothing but tell us what books you own.

> and you refuse to accept anyone else's opinions (even to the
> point of stating that you are right and all the textbooks are wrong).

I call a spade a spade.

I was also the first person to tell the people arguing on this newsgroup about the choke / coil / inductor that their COULD be two points of view, and nobody seemed to want to agree on that. Little change from when I joined this damn group 5 years ago.

Someone has to be right. Everyone has to be wrong. Welcome to the typical CBer mentality. You care to tell me that coax affects the actual SWR at the radio now, since it does, in fact, change the apparent swr of the feedpoint by the transformer action of the coax length?

>
> I won't claim to know everything about electronic circuits or antennas
> but I do have sufficient field experience to know what the hell it is I
> am talking about.

I have set up telephone microwave towers for Nevada Bell.

I have been involved in setting up the broadcast towers for a local radio station as well.

I have been testing and playing with CB radio and amateur radio for 15 years.

I hold a valid "ham" license as well, and have gone so far as to pass the Extra class written (I haven't been able to master the code, so gave up. Now that it is a bit more lenient, I believe I will go back and get the Extra now).

I have also built amplifiers that are capable of far more output than the FCC legal limit for AM / FM broadcast stations.

Would you care to compare actual field experience now? Or go back to textbooks.

short-circuit
> the second harmonic to ground without disturbing things at desired freqs.
> Mixing the two is not uncommon.

And in actuality, some CBs have different methods of doing this.

Some use a series tuned pi net.. Some use a simple L net shunted to ground.

Go look at some real OLD radios, and you will see that they used to use a pi or pi-l network, and that afforded them all the harmonic rejection they needed.

Now, a simple L net shunted to ground is all that is needed. Cut the cost of the second cap in the pi net, and the second cap and inductor in the pi-l.

>
> A trap in an antenna is a parallel resonant circuit designed to present a

So, by your own statement, the trap acts as a choke to the 10 meter signal, preventing it from seeing the rest of the antenna, correct or no?

> On 15 the trap acts as a loading coil so that it takes very little extra
> length to resonate at 21 MHz

So, a trap (which above was classicly told to us behaved EXACTLY like a choke) can also be a loading coil?

Seems to me this is exactly what I was saying the whole time!

where another trap is inserted tuned to about
> 21 and a bit more wire brings it into 20 meters 14 MHz. Mosely many years
> ago did it with one trap.

Side note: Dean Mosely currently has a wireless internet company here in Houston Texas that I used for a long time.

Interestingly enough, he doesn't use Mosely brand antennas. I thought this strange.

Smart mofo, though.

>
> There may or may not be a discrete capacitor.

Correct, because the interwinding capacitance can make up for the lack of the cap.

There is a design in the
> Handbook which uses two coils in series and winds them one above the other
> using capacitance between the windings to resonate the trap.

I have quoted this type of trap in this thread somewhere.

The inductance
> at 3.8 MHz using a 40 meter trap is high enough to only require 87 feet

A series 'LC' circuit for a trap.... Do any commercially
made, trapped antennas, use a series 'LC' trap? Which one?
The 'stinger' (as you call it) is not part of the trap. It
is part of the next lower band's element.
I certainly agree that it's fairly simple electronics/physics.
I also agree that the same principles apply to any frequency.
Maybe when you review your electronics, you might also review
your physics. I think you missed a page or two the first time
through it.

No, the capacitance used for a trap is not the inter-winding
capacitance. That capacitance value (at HF) is much too small,
and is taken into account when designing the coil.
Believe me, there ~is~ a capacitor in ~any~ trap, you may not
recognize it as such, but it's there.

Are you sure your not talking about a filter? Never saw a 'trap'
inside a radio. And, if there is a trap inside the radio, it can't
be the trap that's in the antenna, can it. The part below the next
"---clipped---", is still true.

I am not going to get into a semantic argument on 11 meters where nothing is as it seems. In the real world, a 'choke' is a device designed to inductively oppose the passage of some very broad band of alternating currents where a trap is frequency-specific. A trap is resonant, a choke is not (at least not intentionally). While a parallel trap can act as a loading coil when operated below resonant frequency, an effective choke would generally make a really crappy loading coil.

OK, so some Collins, Henry or Johnson amps use swinging chokes, I don't dispute that, my statement was that most equipment does not use a swinging choke vintage or modern. Your first statement on this indicated that a swinging choke was in common use in most equipment and you could not get good DC otherwise. Then you said that my statement should say most MODERN equipment does not use a swinging choke. My statement is that most MODERN and VINTAGE equipment do not use a swinging choke in the power supply. Try to get it straight for once.

You are playing games with words...
Although a choke and a trap both contain inductors... they are there for different reasons. A "trap" in the electronic sense is a series tuned cicuit that usually is incorporated to shunt a narrow band of frequencies to ground. This is how they are arranged in a typical CB. A trap is almost always on the output of some device (amp, osc...etc).

A choke is also an inductor but has a different role to play. It's normally quite a large inductance in respect to other inductances in the circuit. It's primary use is being put in series with the B+ lead that feeds the circuit in order to feed DC to the circuit in question while eliminating any RF the circuit is generating from leaving the circuit through the B+ lead.

A trap really is a type of filter when you get right down to it... it can be considered a band-stop filter. Many radios have this right at the output. It takes the form of a capacitor and air inductor in series from the output to ground...

No? Wrong answer bubba.

ARRL Manual, 1985. Page 20.22, first column, 3rd paragraph down, in the
Physically Short Verticals section:

"With center loading, the portion of the antenna below the coil caries high current, and in the top loaded version, the entire vertical element carries high current......"

The neon light trick also works because the ends of the antenna are at voltage maxima.

> > If a coil is
> > > used to increas the electrical length of an antenna, it is

>

Tell me where I said that the stinger WASN'T a part of the antenna?

I said the stinger made of the rest of the series L network... The network formed by the L of the coil, and the C added as the stinger.

The stinger ALSO can have a capacitance hat, if it isn't able to provide enough C with respect to the operating frequency. The antenna must be in resonance with the frequency, and the capacitance hat can provide this.

> > I have trapped yagis that have NO capacitor in them. Are they not

> have traps in them? You may not ~think~ there's a capacitor, but
> there is.

Built one myself.

No capacitor, other than the capacitance provided in the space between the turns.

Hrm. Guess I was wrong. I MUST have put a cap in their somewhere.

Sure does seem to me that the turns in the coil affect a choke, since the rest of the length of the antenna isn't seen at 10 meters.

You might ask how various traps are made, you may be
> suprized at what you learn. No, the coils in the trap does NOT
> act as a choke.

I still don't see how you can not see this. I have quoted from the texts, proven my point, and still you argue.

>
> > Would a magnet mount dual band antenna not use the inductor inserted midway

> >
> ---> Most of the time the current maximum is at the feed point. So
> to
> answer your question...No.

Wrong again.

This is elementary. The antenna has voltage maxima at the ends of the antennas. Take a neon light and attach it at the middle of the antenna. Chances are, it won't light (with normal power levels). Put it at the end of the antenna opposite the feedpoint. Bet it willl light now!

>

I refer you to ARRL Handbook, 1995, Page 19.14, Fig 19.12.C

It actually acts as a balun.

>
> > Using another piece of coax, it is actually possible to extend the BW of the

No, actually this does. Read the areas of the ARRL handbook I showed above.

If you have access to the ARRL Antenna Compendiums or the ARRL antenna handbook, you will be surprised.

And I can tell, you have no idea what I am talking about. Pity you.

Really?

I have built some multiband trapped verticals as well as beam antennas.

I used no capacitors.

How do they work.

Enlighten us, oh ye who can seem to tell all about the new math / new physics.

Toll Free:

Please don't take this as an inference that you, or anyone for that
matter, is wrong.

I ::think:: what Doc is trying to say is that, in a trap, the coil
adds capacitance to the circuit, through some interactive function
which I myself do not understand.

I do not think he was inferring that an actual, physical, component
called a capacitor is in the circuit/coil/trap/filter/choke/whatever.

Of course, this is just what I've gathered, and just my two cents.

A simple shunt fed final is a pretty good example of a parallel trap,
particularly link-coupled. A bit rare these days but perfectly possible.

why does it have to get 800 watts I get at 15 volts 350+/- rms and 1000+/- peak with a cobra 29 hitting it. I would have to say it is rather efficient design. 15v x 55 or less amperes = 825 watts /350rms p.o. = 42% efficiency is that to much to ask out of a class c amplifier?

Hello Don: Not even a good try.

I talked with a marketing executive back in the mid 1980's. Yaesu believed at that time 30% to 40% of there amateur transceivers where sold to marine, freeband, and other types of customers.

Today you can call any of the dealers up, and have them ready to go, most freeband guys check em out before takin delivery. Buck$ talk whining walks.

Just think Don us CB'ers are savin ya a some doe, by creating a mass market to kept the price down for amateur radios fer ya. And your complaining about it. Talk about bitching if ya was hung with a new rope.

I am sure the amateur radio manufactures will listen to and develop a non 11 meter radio. Riiiiiiiiiiiiiiiiiiiiiiiigh!

Most real amateurs want the CB'ers to have a good designed radio. For two good reasons, one it reduces some interference problems, and even promotes the use ham radio, which you do not.

Don go back and practice some morse code, and I am sure your quit good at running off prospective new comers to ham radio, with your whining complaining ways. Waaaaaaaaaaa Waaaaaaaaaa

My 5th grade teacher (Mr. Johnson) said you will always have goof balls who will have a dime holdin up a dollar.

Don you need to slid on down to the Mojave Desert here. Even got a train station and Bakersfield. We is ah goin ta have a big CB Break in Barstow next month. Maybe ya'all can come and meet a few of the boys? We can pull ah cork, tip a few, eye ball all the honies, and tell lies. What yeah say? Maybe ya's can pick up a good used Yaesu that even works on the other channels like 160, 80, 40, 20, 17, 15, 12, and 11. Maybe we'll hook ya up with T-Bone Sally.

Rockin & Rollin in the Great Mojave Desert .....
jay123a@qnet.com just down the road ah ways from the fillin station.

Let me clarify, it is limited to R&D of over drive and overvolt. I know this is not proper design, but it seems to me to be a new fad, I mean there is a lot of guys interested in the hobby of "keydowns". You know as well as I do that all RF transistors are tested at the factory in a situation that highly resembles the way people run there amps in a keydown, they do this to test the durability of the transistors. The only thing that doesn't resemble Motorola & Toshiba's test is that most "keydowners" usually have a decent SWR as opposed to the test facility where the transistors are subjected to a substantial mismatch and overvolting as well as overdrive. Now I am not saying that the literature written by Motorola is not well informed, but more so not in any way involved with what most of the "keydowners" are doing which is drag racing these transistors. Most people yearn for information concerning keydown amplifier design, Motorola could make a killing on these publications. That's what I mean by "limited"

4979. Re: DTI Tuner Interface PLL query....

Newsgroup: rec.radio.cb
Date: 2000-09-10 05:22:29 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8pf5sdrml1@slb1.atl.mindspring.net>
Source record: 51319

Robert,

I have also been interested in the DTI interface, but haven't been able to make contact on any of the email addresses.

There is a computer control kit out for the pll02a chip from BigMouth CB products, and the basic interface could control any PLL that allows binary input beyond the 40 channels (some of the newer PLLs have the addressing pins internally disconnected).

You need to get the PLL data sheet to determine the "Weighting" of the chip, and program for the binary equivalents. The 145106 requires more hardware than most to get additional coverage. Two 4008 binary adders and another 4XXX cmos chip (can't remember number) are needed to generate the codes needed to address it. There are far easier PLLs out there to work with.

On the 9 binary input bits, you have 1,2,4,8,16,32,64,128 and 256. This adds up to 1 less than 2 X 256, or 511 channel capability. If I remember correctly, the 145106 starts with a binary weight of 91 for channel one and goes up to 135 for channel 40. If my recall is correct, that would give you 90 channel capability below one (40 channels=455 KHz or 45 channels when you add the "A" channels), 2 X 45 = 90, or 2 banks of 40 channels with "A" channels if you access the 1/2 reference input pin (1/2 the 10.240 ref oscillator) and enable the clarifier for transmit. Above 40 you would have 511 - 135, or 376 channels possible starting at 27.415 and going up. Many radios aren't broadbanded enough to handle this drastic of an expansion.

Each PLL that uses binary works in the same manner. Some are BCD (Binary Coded Decimal) only, others are selectable between binary and BCD and some are simply BCD for 40 channels and no pins are active to allow anything additional. Lou Franklin's PLL Databook is an excellent reference if you want to experiment in this area.

You can emulate the same control as the interface offers manually by using a 10 position Dip switch bank and 10 1N4148 diodes on a PCB with ribbon cable (Like used to connect a hard drive). By disconnection the channel selector going to a binary addressed PLL (and wiring in your experimenter board with the dip switches) , you can switch in the codes for up to 10 addressing pins, or 1023 possible channels (if you find a PLL that will go this far and a radio broadbanded enough to respond to the frequency created by the PLL). Most of the PLLs respond to TTL logic signals consisting of voltage less than 5 volts or ground on the addressing pins to represent one of 2 states: HIGH which is +5 VDC and is a binary 1, or LOW which is Ground and represents a binary 0. A quick example of the programming would be the binary for channel one on a PLL that is weighted for a binary 91 for channel one. This code would be based on binary progressions

(1,2,4,8,16,32,64..... to the number of addressing bits). The code would be the same as adding 64 plus 16 to get 80 which leaves you needing 11 more to get 91. This would be 8 + 2 +1, giving you HIGHS for 1,2,8,16 and 64 which would be (LSB least significant bit first) - 1101101 (1*1 + 1*2 + 0*4 +1*8 + 1*16 + 0*32 + 1*64). All other weights up to the capabilities of the PLL are determined the same way. Once you have the radio "unmarried" from the channel selector switch, there is no need for a "Band" switch and there are no gaps on the "A" channels (3A, 7A, 11A, 15A, 19A) and their equivalents on each of the "bands" selected by band select switch).

I hope this makes some sense, and my explanation probably leaves a lot to be desuetude with a lot of unexplained gaps.

The 145106 is a tough PLL to cut your teeth on. Copper and HY Electronics (I am sure there are others also) sell a "Channel Board" for radios using the 145106 and it is probably the easiest way to go. It still requires installation by someone familiar with the 145106 PLL.

Clear as Mud?
Hope it helps a little......

A choke is an inductor used in a specific manner, usually to pass DC and restrict the flow of AC. Sometimes just to restrict AC and somtimes to allow lower freq AC to pass freely and restict a higher freq AC. In general it is considered a low pass filter or element of one..

Lots of times.

They put them in the middle of an element to get it to resonate at more than
one frequency.

OK

Let me break this down into simpleton so that even you will understand.

Most vintage amplifiers, commercial, and top end amateur, used a swinging choke to filter DC.

Nice play at some word games, but the bottom line is this: Dig some schematics out, and see what was the word of the day.. Swinging choke.

They are still used in ultra high end military, commercial, and a limited number of manufacturers of amateur grade equipment (albeit VERY few).

Mebbe the stuff you work on was just on the low end of the scale, for the day.

High power / vintage equipment used swinging choke.

Low power (exciters, rx, etc) used capacitive input.

SB,

I had stated earlier that it was the capacitance created between the windings of the choke / inductor / trap coil / loading coil / whatever the fuck is politically correct for rec.radio.cb this week.

He said no, that wasn't it.

See, in between the windings that comprise the choke / inductor / coil / trap, their exists capacitance. That makes up the "other half" of the network.

However, this "coil" also acts just like a choke in this manner. These people just don't seem to get it.

I wonder what they would call an inductor in series with a stripline type antenna?

> I am not going to get into a semantic argument on 11 meters where nothing
is
> as it seems.

LOL.

Actually, on 11 meters, it is broken down so simply that the amateur
operators can't take it.

They have to make it seem "Entirely too technical, and that is what
seperates us from those filthy damn CBers".

In the real world, a 'choke' is a device designed to
> inductively oppose the passage of some very broad band of alternating
> currents where a trap is frequency-specific.

Wrong.

A choke is only resonant as a factor of it's Q.

If you have a coil that is hi Q, it will have limited bandwith.

A choke that has low Q will, and does, pass a bigger amount of spectrum.

Elementary, my dear Watson.

A trap is resonant, a choke is
> not (at least not intentionally). While a parallel trap can act as a
loading
> coil when operated below resonant frequency, an effective choke would
> generally make a really crappy loading coil.

Only because a Choke, as you are thinking of it, is high Q.

The load in an antenna is lower Q.

> You are playing games with words...

No, I am not.

I have broken it down as elementary as it can be, you and your followers have lost the argument, and rather sit, learn, and admit defeat, you choose to battle against it.

> Although a choke and a trap both contain inductors... they are there for
> different reasons.

No, they are not.

A choke is their to block the AC signal from going through it, whatever the frequency chosen.

A trap is in the antenna to block the AC signal from going through it, whatever the frequency chosen.

A "trap" in the electronic sense is a series tuned cicuit
> that usually is incorporated to shunt a narrow band of frequencies to
> ground.

Not necessarily. It doesn't have to shunt to ground, but otherwise, your seemingly right.

This is how they are arranged in a typical CB. A trap is almost
> always on the output of some device (amp, osc...etc).
>
> A choke is also an inductor but has a different role to play.

No, it has the exact same role to play... That is, it blocks the flow of a specific AC frequency or frequencies.

I am not going to argue with you.
I no longer have to prove a point here.
the fact is, you made a generalization and got called on the carpet
for it.

The last statement you made to me in as much as called me illiterate.
The statement you make below impugns my quality of education.

At this point, I am simply aware that you no longer are discussing
technical items related to coils/inductors.

Attacks upon my character show a remarkable lack of maturity.
I now close this "conversation".

I have made my point and see no further useful purpose to this
discussion.

thank you.

Toll Free,
I think I agree with that last part, 'pity me'. I'm beginning to think that my trying to explain semantics to you is pathetic. Shame on me!
So, to preserve what little self esteem I have left, I make the following anouncement;

You may call your cat a dog for as long as you like. I will not try to show you the error of your ways, I will no longer correct your mistakes, you may make as many silly statements as you like. But, when you get that cat to barking, please let me know.
'Doc

---clipped----

I would think that if it were ignition noise the tone/frequency
would change with engine speed. Since it doesn't, I'd start looking
at other 'things'. What's running, or on, with the engine running?
No idea if Toyota uses an electric oil pump, but it's something to
wonder about(can you tell I'm no mechanic?).
Use the 470mF cap' to check across the fuses in the fuse panel.
I don't know about the computer, but don't think I'd by-pass it. You
might try shielding it though. A cap to ground in a computer lead
might change input/output instructions to the engine, that'd be a
'no-no', I'd think.
You might try red, or green. Blue may not be 'your' color...

Cross-posted to:
alt.radio.scanner.flame_fest,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.cb,rec.radio.scanner,rec.radio.shortwave

A good move, although it should have been done 25 years ago
in the USA. It's really too late anyway. The damage is already
done. There are few, if any, 20 and younger people interested in
ham radio. What young person today, apart from the offspring
of hams, are interested in a ham licence? Really, ask yourself this
question, HONESTLY, and put aside the pre-programmed obsolete
mantra that ham radio is some kind of a vital and technologically
active endeavor in 2000. Put a fully equipped Pentium-III MMX system
next to an Icom and what do you think the majority of the young people
will choose to play with in the Year 2000 and beyond...??

Answer the question...be honest now ! (if you said ham radio, I wish you
luck)

Ok. But.....why? What would YOU gain personally from this? What? You sent them all a letter expressing your views? You are in direct contact with the board of directors? You expect the top executives to "call" you back and thank you for pointing out the error of their ways? I really want to know how this benefits you.

5006. Re: N9VKS: Indiana ham arrested for having a scanner

> Receivers only or transmitters/receivers.

.....IMHO.. IF your talking Amateur (or SWL) receivers vs. transceivers....
I'd say they're both in the same league (assuming you're not comparing
apples and oranges and compare rigs with comparable features). The
electronics inside and circuit designs are the basically the same if you're
comparing a transceiver vs. a receive-only rig (similar class rigs) from the
same manufacturer. From what I've seen of the Amateur transceiver market
vs. the SWL receiver-only market, you pay NEARLY the same (usually less than
a 20% difference) for either comparable product.... so WHY NOT get the
transceiver?

Honest answer: you are right. But what has that got to do with CW?
CW requirements only hindered the brain dead CBers that wanted to free band
a little more than they have.

Had nothing to do with radio vs internet. I have 3 kids, all big into
computers. It is insulting to suggest they are too stupid to learn CW.
They did (in 2 days) but just rather be on the net. Give away 'ham'
licenses like CB, you will still have the same lack of interest issue.

so you win. 10-4

The real Damper behind Ham Radio, I see, is the overly restrictive
neighborhood covenants and zoning laws. I remember in the late 70's you
could'nt go several houses without seeing a CB antenna sticking up on
someone chimmney or roof. If CB was introduced today it would never flourish
or even survive like it did then.
Of course you are saying that is CB radio. What about Ham radio? The truth
is the public really does'nt know or care. When they hear that your
unsightly antennna is radiating something they do'nt want to have anything
to do with it. Plus they remember the neighbors that had those ugly antennas
on their roof and came in on their phones and TV. I only see it getting
worse with the FCC now requiring you to be RF compliant with your station.
Does this mean eventually you will have to disclose to your neighbors your
enviromental impact on their property? Will they be able to point and click
on an FCC database one day and see where your ham station is and imagine
those harmful waves enveloping their property?
When the public thinks of radiation they think of a nuclear reactor or that
awful cellular tower that was about to go up down the road until they all
banded together and squashed it. Nevermind the cellphone that they just
talked on all the way home from work.
That is different.....

Is it really necessary for this crap to be on seven usenet sites?
Particularly when this 'official abolishment' comes from a group that does
not set rules. It will come when the ITU acts and it is currently not on
the agenda for the next six years. Don't stand on one leg.

Thats pep or carrier.

When talking, it will come back to mid 3K I generally see a 2Kw deadkey
(just becuase that is where I like to run it), and modulate up to 3 to 3.5
from their.

No, and that is exactly what I said.

Your talking a completely different ballgame than a sweet sixteen.

A sweet sixteen is a class AB biased amplifier.

Who gives a shit what your class C amp will produce when someone is asking about the current draw of a AB amp?

THAT, was my point, sir. All that served to do was create confusion on the part of the person asking the question.

Why are you posting about a Class C amp?

The Sweet Sixteen is an AB amp?

Your post had absolutely NO relevance to the question posted.

That is why I posted what I did... To let the original poster know that you where:

A. Full of shit.
B. Talking about an amp that was a completely different ballpark than the biased Sweet Sixteen
C. Just posting to type.

Take your pick from the above, but your post served absolutely NO relevance in the question being raised.

All up in the Kool-Aide and he don't even know the flavor.. Geeze!

Sounds like you are chasing your butt. There is always going to be some noise and taking the antenna off will reduce it,duh. Turn the ignition on but do not crank it, If the noise is still there it is either electric fuel pump or the trucks computer. If the noise is only their when the truck is running it is probably alternator or ignition noise. If the noise is there when you are in the accesory position it is probably just normal background noise.

> I am not going to argue with you.

You never had an argument. Like others on this subject, you where arguing a point of semantics.

Once called upon it, you started to generalize by telling us what books you owned. Multiple times I had asked for you to tell us WHERE in these "supposed" books your points where being proven.

Nearly every time I posted something from a text, I would give edition, page, paragraph and column in the book, to make it easy for people to follow along.

NOBODY here is going to spend the time to read 3, 4, 5 hundred or even thousand page texts to see what you are talking about.

> I no longer have to prove a point here.

You never did.

> the fact is, you made a generalization and got called on the carpet
> for it.

No, the fact is I made a statement, and a couple people where quick to jump on the bandwagon for it.

I proved my side of it, by calling industry standard texts, citing specific references, and no other person was able to do so.

>
> The last statement you made to me in as much as called me illiterate.

Nope. Just calling your knowledge of the subject into play. Sorry if it offended you.

That idiot Prozac tried the same thing, and many, many people called him on it. He no longer "touts" his education, because after a while, people understood that he had not a clue one as to what he was talking about.

> The statement you make below impugns my quality of education.

Nope. But, if you feel that your education doesn't have any merit, I feel sorry for you.

What I AM calling into play here is that you don't understand what you are talking about completely.

You seem to have an inferiority complex. I feel very sorry for you because of that.

>
> At this point, I am simply aware that you no longer are discussing
> technical items related to coils/inductors.

No. Again, you are wrong.

>
> Attacks upon my character show a remarkable lack of maturity.
> I now close this "conversation".

Oh gee, Eric. Glad to know that you have "closed it".

I never once attacked your character. I attacked your "supposed" knowledge of the subject we where discussing, since you REPEATEDLY told us what books you had, cited no specific references from those books, and contradicted yourself once.

YOU are the person who played the lame "Well, since you said I didn't understand what I was reading, you must be calling me illiterate, and attacking my character, as well as telling me I was inferring the quality of your education was inferior.

1. Never once did I tell you that your illiterate. I told you that you didn't understand some of the things you where taught. Look up illiterate in the dictionary.
b. Please see http://www.dictionary.com/cgi-bin/dict.pl?term=illiterate The dictionary term for illiterate is unable to read and write. Seems you have proven that you CAN read and write. Your comprehension skills are what I called into play. Since you didn't know what illiterate meant, I would attest that you DO have reading comprehension skills problems.

2. I never attacked your character. That would have been stupid. What I did do was call your understanding of the topic of discussion into play.

Sorry to have offended you Eric. I sense that you are blind. That is a disadvantage, since you can't actually SEE the figures and tables I pointed out. Maybe that is also why you couldn't cite specific references.

This could also explain why you don't completely understand my point(s) being made.

Maybe if you stopped defending yourself, and actually listened to what was being presented, you would see that their is something to be learned from this discussion.

>
> I have made my point and see no further useful purpose to this
> discussion.

Your point has been invalid the entire time... Or at least flawed.

Have a good day Eric.

Good.

Problem solved.

Their was no frustration, other than trying to educate people who are as
closed minded as can be.

Just like 2 years ago, when you tried to tell us that when the voltage on
the collector of a transistor was increased, you WOULDN'T have a substantial
increase in current draw.

LOL. It figures that the four hard core outlaws - Jay, Toll Free, TimNebo, and Twistedhed - would object the loudest.

The plan (that Kenwood is already looking into) still allows 1 thru 30 Mhz transceive for military and commercial applications. Only the frequency range between 26.965 to 28.000 is locked out, similar to the cellular band lockout in scanners.

However the design involves a set of volatile PC traces. If you try and unsolder (or solder to) the PROM (or one of it's legs) the connections in the middle layer (sandwich) of the multilayer board are destroyed, and the only recourse is to replace it with a new mother board. Replacing the mother board gets very expensive very fast, discouraging further frequency tampering.

A very simple, elegant, easy to implement solution. No I didn't invent it. But I do approve of it.

Thanks everyone who responded to this thread. Based on these responses I going to rethink my purchase of the RCI 6900. It seems what makes the most sense is to either buy the high end Kenwood (or something similar), or buy a nicely tuned basic Uniden (or something similar) for $150 or so. The extra $250 for the 6900 over a good "basic" CB doesnt make much sense because one probably cant tell much difference between the two (right?). My budget is nudging me towards less expensive alternative. Gonna give myself 24 hours to mull this over then pull the trigger on ordering something tomorrow. Thanks again for all the responses.

Nick

I don't believe that Ham is any where near dead just because 20 year olds would rather play with computers over a radio.

Perhaps when they get older they may take interest in the hobby. Certainly ham is not for everyone, neither is scanning, shortwave, or astronomy. So what?

I will agree that CW is a total waste of time, and it was a good move to make a no code license. As for the old timer hams still out there, they will never stop defending it, even though they never or next to never use it.

However don't over look the the computer connection to ham, SW, and even astronomy. We all now have the capabilities that only a small hand full of people had 20 years ago. Wonder how much more advanced the next 20 years will be. Perhaps there will be some new prophet of doom making a simular post regarding the death of computers by way of the next big thing. Hard drives, keyboards, and monitors may become just as obsolete as CW. What would hologram virtual memory, and something on the line of the matrix, this could all some day be considered obsolete.

So lets just enjoy what we have for now, and not worry about what may happen or not happen ;)

Hello Don k4kyv@hotmail.com

Riiiiiiiiiiiiiiiight in your dreams turd jerk.

Do you really think that the radio manufactures would want this type of
idiotic type publicity. They have a hard enough time keeping what they
got running. They would laugh in your face, Don you are a dreamer, and a
first class goof ball. Your lack of technical reality is a joke, just
like you.

Notoriety at last .... "Bitchen"

"volatile PC traces" I am in tears from laughter.

Ham radio shows its need everytime there is a disaster and
all the "technology" fails. All the phone lines, power lines, TV
cable, etc., get knocked down everytime we have a serious
hurricane in FL. BTW, our local police, fire, and medical all
use an EDACS system, which is computer controlled. If the
central station takes a hit, there will be no communication.
There are plenty of instances across the country where this
has already happened. Our local Ham radio operators
work with local officials to maintain communications. Every
week Ham radio operators participating in disaster preparedness
call in on the net.

It is a real shame CW is now gone. Again, when technology
fails, what are you going to do? With nothing more than a
reflective piece of metal I can communicate with someone
miles away, provided they aren't too technologically advanced!

Yes, technology is wonderful. Many Ham radio operators are
deep into the latest toys, as I am. However, we don't fool
ourselves into thinking it can't all be taken away with 1 storm.
A small, category 1 hurricane (Erin) knocked out power to
18,000 homes for more than 3 days. This was a tiny storm
compared to hurricane Andrew.

Been there, done that.

Robert

You have to admit that all that bandwidth available to me as a relatively new Ham means that reliable World Wide QSO's are a viable option now that I'll get no interference locally.

Regarding the P3 and ICOM, the ICOM will be worth considerably more than the P3 in 2020, or indeed within 18 months.

Not that I'm leaning one way or the other, but I have only one ICOM, four Yaesu's and an old Pye. Along with a P3, P2, K62 and a 486DX-4...I must be a nut too!

Ah, x, I am beginning to comprehend just exactly what your game plan is. Most freebanders could care less about the other bands and there are more than enough radios out there to meet our supply to get us where we are going. Just because I (we?) feel that the feds are wrong about the limited radius they imposed on cb and how gobs of frequency space is wasted, we are outlaws? Oh, well. Just for the record, I don't think Toll was disagreeing with you. Let me know when that radio comes out. If it's worth it's salt, I'll buy one and send it to Toll to mod. Hell, your idea could actually serve all parties. Imagine if they take your idea, run with it and make a radio just like you describe, except they find it's even better than whats on the market now. It's all the rage, everyone buys one, (cause by now the price came way down) and now all us "outlaws" have better sounding radios once the mod is done to the anti-mod mod. And you still have your radio with the anti-mod mod to prevent mods.

5048. Realistic 457 40ch ssb- Help- (Long)

Source record: 51534

Turned unit on and no audio out of speaker, though meter showed receive. Put an extension speaker jack in the ext. spkr. jack hole on the back of radio and nothing. Put a big plug in the Phone Jack on the front of radio, nothing. When I removed the Head Phone Jack, all of a sudden got audio from speaker. Radio worked like a charm for a couple of hours then I removed it from the test bench and put it on station. Hooked everything back up, turned it on, nothing from the speaker again. Tried the headphone jack trick again, no deal. I removed bottom cover to check connection and to see if the headphone jack was releasing ok when jack was removed. Seems ok. Radio very dirty inside so I cleaned the contacts on every switch and on the various jacks, etc. Let the radio sit overnight to "Dry out." Came down the next morning, turned her on, nothing. Tried the plug trick again and this time it worked. Radio worked for, oh, about 45 minutes and then, when I was switching from one radio to another, then back to the 457, it didn't come back up.
Sorry for the length of this post but I'm trying to give all the information. I'm stumped!

It sounds like maybe your ext speaker jack isn't returning to the proper
position when you pull out the plug. It has a spring loaded clip that should
connect the internal speaker when the jack is pulled out. If if doesn't...
the speaker will not be connected. I suggest jumping the jack inside the set
to see if the speaker comes on...

I have an old Cobra 20 Plus that is missing a power cord and I can't find anyone that carries it, is there anywhere online that I can buy one? It is a three prong male socket with what looks like three seperate holes for the corresponding female "prongs" and has the little nub thing on the top of the plastic casing where the cord would hook onto.. its is kind of hard to explain but I bet if you have seen what this socket looks like you will know what I am saying.. email me at: mp@popamericana.com

5058. Why Hams Are Getting Even More Pissed

Newsgroup: rec.radio.cb
Date: 2000-09-11 00:00:22 UTC
From: x34956171135@aol.com
Message-ID: <20000910200022.26436.00000643@ng-bd1.aol.com>
Source record: 51544

10 meters is opening almost daily after months of low solar activity. And the number of CB/unlicensed interlopers is increasing, too. No,they are not spanish-speaking stations. These boys are from the Good old USA and they should know better.

Heard on 28.435 USB Mhz today while west coast hams were attempting to work a Japanese station, a southern accented voice broke in:

"How bout it ya got that that one one one here. Anybody
got a copy on that one one one out there?"

A ham asked this guy to please move and informed him that he was on an amateur band. His reply:

"You say ya want me to move to nuther channel? Where
you at? This is that one one one here"

They took to ignoring him. But he went on transmitting, often over amateur transmissions, blocking out the Japanese station in the process.

"CQ DX this is one one one here, one one one, one one
one, anybody copy?....."

That's in ITU3, we're in ITU2. And personally, I think we need to keep the code requirement to keep the idiots off of HF (my definition of idiots is people who run 1500 watts, kerchunk repeaters, don't identify themselfs, and (ahumm), cross-post newsgroups :)).

Yes, I agree. Ham isn't for everyone. But it's certainly not obsolete.
I don't even know half the code, but I won't ever stop defending it. Truth
is, I'll probably never have a single QSO with CW, heck, I'll probably never
even buy a key, but I truely belive that CW is a great way to keep the idiots
off HF......

OK, let me break this down into stupid so that even you will understand.

Eric Oyen posted:

> For instance, when placed in series between the power supply and the circuit, it effectively CHOKES off AC signals to the
> DC power supply. in this arrangement, along with a capacitor shunted to "ground" it behaves as a filter.
>

And you in your infinite wisdom spluttered:

> No, not really.
>
> Your thinking of a swinging choke, and the capacitor serves to resonate the swinging choke during the entire
> current draw.
>
> Otherwise, you end up with crappy DC that still has the AC component on it. The swinging choke preserves
> the flywheel effect (just like the tank circuit of a tube amplifier), however, in this case, we are not resonating it
> to preserve the AC component, we are filling the void of the negative portion of the rectified DC.
>

Eric was referring to the simple choke used in most power supplies. But you imply that all power supplies use swinging chokes otherwise you get "crappy DC". And my reply to that was that MOST power supplies DO NOT use a swinging choke, and they do not get crappy DC. The swinging choke has more to do with regulation that filtering. I also stated that I have worked on lots of vintage equipment and none use a swinging choke. By the way, even with a swinging choke there is still some AC component.

And again you blathered:

> That should read very few MODERN DAY power supplies use a swinging choke.
>
To which I replied that my vintage radios go back to the 1920's and up to the 1940's, some of my ham gear goes back to the 1950's, I have rebuilt a number of amplifiers for 1930 and 1940's juke boxes, and none used a swinging choke, so it
does not apply just to MODERN DAY power supplies.

Anything you don't understand so far?

And again you stuttered:

> Most vintage amplifiers, commercial, and top end amateur, used a
> swinging
> choke to filter DC.
>

I never disputed that, you first implications was that it was common in power supplies to use a swinging choke and that you could not get good DC without it. The power supply my Collins (read high end) S-Line does not use a swinging choke. It uses a choke input filter with two chokes, the first one is 8 hy and the second one is 1 hy, neither of which are swinging chokes, but that is not to say that some did not/do not swinging chokes.

And again you say:

> Nice play at some word games, but the bottom line is this: Dig some
> schematics out, and see what was the word of the day.. Swinging choke.
>

I can show you volumes of Rider's manuals of vintage equipment of the day with thousands of schematics and you would be hard pressed to find one that used a swinging choke, not common at all as you first tried to indicate.

And again:

> They are still used in ultra high end military, commercial, and a limited
> number of manufacturers of amateur grade equipment (albeit VERY few).
>

So now you finally say they are used in ultra high end military, commercial, and limited ham gear. So the use of a swinging choke in a power supply isn't very common as you first tried to convince us I guess.

Is that simple enough?

OK

>
> Let me break this down into simpleton so that even you will understand.

How about "both" as an answer. You seem to think it is a choice between one thing OR the other, computer OR radio. People can, and do, buy both. Computers and radio can exist side by side in the same room, just like it does for most of the people in this newsgroup. Computer users often have other interests outside of the internet, and there is no reason radio cannot be one of those interests.

> Again - it's TOO LATE. Ham Radio will be DEAD
> and FORGOTTEN by 2020. [snip]

Nonsense. People have been running around carrying signs declaring the end of the world for ham radio for years now, and it is not dead yet. Ham radio is evolving, adapting, and finding its place in the changing world. When it does, it will remain just as viable twenty years from now as it is was twenty years ago.

Wow, even if you were lucky enough to hook up with the one in
200 who can read Morse code, how would you know how to aim the
metal and hold it perfectly aimed and still for a dash? How
would you compensate for the rotation of the earth?

Get a laptop, a barbeque grill, a car battery operated refridgerator,
a car battery for your radio, a shortwave radio, and a small generator
(to charge all the batteries). With those items, life after a storm is
no great problem.

I've been through three storms now. After the first (Hugo), I was
well prepared in advance and the other two were almost like a vacation.
I sit around eating steaks and hamburgers, talking on my radio,
listening to music on the SW, and playing computer games on the laptop.
I was having such a good time, I was almost sorry to see things get back
to normal.

Sigh ... they'll learn. Based upon the amateur band, amateurs may have
priority or not - in any case, they are protected from unlicensed
stations. What this means is that the amateur can jump all over the
unlicensed station with impunity - he or she is not interfering with a
licensed station. Below the voice bands, any digital mode (CW, FSK,
AMTOR, ASCII, etc) will generally tear up an AM or SSB station. Even
if the AM or SSB station is running more power. Up in the phone bands,
CW IS legal. I assure you, I have blasted through a 500 watt AM
station running just 75 watts of CW. Understand that a 500 watt

carrier AM station only has 125 watts max in either sideband and 75 watts sitting about 1 KHz from carrier will decimate the signal. All you need are about half a dozen amateur station just waiting ... waiting ... you'll run em out. Even if the hams are running only 100 watts. (of course, it helps to have another half dozen full gallons - or are they called 1 1/2 gallons these days - waiting in the wings - that could dust a 5 kw station if need be)

- Jim

All you have to do is look at companies like AOR and Yupetiru to see that they would still be bringing them in.

Not to mention the fact my Kenwood instantly double in power.

Guess that means I would also be able to run upper 12 meters to bottom 11 meters, as well.

Some people just don't get it.

zzzzzzzz

I maintain that most old amateur gear uses a swinging choke for high current, high voltage power supplies.

If they didn't, why do I have a closet full of swinging chokes removed from old stuff?

Have a nice day.
